H J CLOUT
Gen Superintendent

ACETYLCHOLINE THERAPY IN EPILEPSY

BY

J E S LLOYD M B

SECOND ASSISTANT MEDICAL OFFICER CANE HILL MENTAL HOSPITAL

A diminution in the number of fits of epileptics following administration of choline derivatives has been recorded in French journals The following investigation of the subject was carried out at Cane Hill Mental Hospital with the permission and help of Dr Lilly the medical superintendent

METHOD

In order to avoid any risk of decomposition the acetylcholine bromide solution was prepared immediately before injection The volume of the injection was maintained at 1 c cm and sterile distilled water was used as the solvent Twenty-one epileptic patients were treated by acetylcholine injections and a similar number of control epileptic patients were given an equal volume of saline hypodermically The dose of acetylcholine was during February 1933 0 12 gram once daily During March the dose was 0 12 gram twice daily All medicines that the patients had been receiving before the course were continued unchanged In April 1933 seven patients were given increasing doses of acetylcholine bromide until they were receiving 0 5 gram hypodermically twice daily The tables show the numbers of fits per month compared with the average numbers per month of 1932

Choline Treatment						Saline Controls					
Case No	Age at onset of fits	Age in 1933	Average fits per 28 days in 1932	February 1 to 28 1933	March 1 to 28 1933	Case No	Age at onset of fits	Age in 1933	Average fits per 28 days in 1932	February 1 to 28 1933	March 1 to 28 1933

17	6	9	33	7	12
19	10	7	Total	60	75

An attempt was made to ascertain whether the intracranial pressure was affected by the hypodermic injection of 0 5 gram acetylcholine bromide In the case of six patients and six controls the cerebro-spinal fluid pressure was measured immediately before and at one minute intervals following the injection The observations were continued for ninety minutes after the injection No significant alteration of the cerebro-spinal pressure was noted No subjective or objective symptoms following the injections were noted in any case

The conclusion arrived at is that acetylcholine bromide does not diminish the number of epileptic fits No change in the character of the fits or of the mental condition of the patients was observed during the course

THE USES AND DANGERS OF COSMETICS

BY

ALICE CARLETON M A M B

ASSISTANT PHYSICIAN DEPARTMENT OF DERMATOLOGY RADCLIFFE INFIRMARY OXFORD

It has been estimated that the fourth largest industry in the United States of America is concerned with the manufacture of cosmetic preparations If they are as is said less commonly used in this country they enter none the less into the daily life of an immense number of women And it is therefore a matter of interest not only to the dermatologist but also to the practitioner to consider their potentialities for good or ill

A formidable list can be made out of cosmetic constituents which have produced harmful results I think the length of the list has sometimes influenced the views of writers on the subject and obscured the fact that many of these substances have caused injurious effects only in rare cases and have otherwise been found harmless or even beneficial I do not propose to make an exhaustive list of substances which have proved irritating or toxic in one or two recorded instances but only to consider a few common preparations and their potentially harmful ingredients

SOME COMMON PREPARATIONS

Powders —Toilet powders consist of a mixture of animal or vegetable powders colouring matter and perfume The vegetable powders include rice wheat corn flour starch acacia and tragacanth The mineral powders in use are chalk talc kaolin magnesium carbonate bismuth nitrate or carbonate and zinc oxide The dyes may be of vegetable origin or may be aniline derivatives Various ethereal oils are used as perfumes and orris root is frequently employed as a fixative The majority of these substances are entirely harmless and unperfumed untinted powders are used in dermatological practice The most dangerous powder ingredient to which most of the recorded instances of poisoning from this source are due is lead Either in the form of lead acetate or lead carbonate this seems to have been a very common powder ingredient in the past though the use of lead acetate is surprising since it is so easily soluble that a shower of rain would dissolve it away But its danger has

ROYAL ARMY MEDICAL CORPS.

TWENTY-FIVE permanent COMMISSIONS in the ROYAL ARMY MEDICAL CORPS will be offered on July 27th, 1933 Applications should reach the War Office not later than July 21st, 1933

Candidates will be selected for commissions without competitive examination, and will be required to present themselves in London for interview and medical examination on July 27th 1933 They must be under 28 years of age on August 1st, 1933, and registered under the Medical Acts

Officers of the R A M C are liable to serve in any part of the world where British troops are quartered

Ample opportunities exist in the Army for clinical professional work both Medical and Surgical, as well as for the study and practice of Hygiene, Pathology, and all the special branches

The cost of Post-Graduate study, which is compulsory, is met from Army Funds

Emoluments Pay—From £356 to £1,542 a year according to rank **Allowances**—Free quarters, fuel and light servant and rations, or cash allowances in lieu, totalling from 6/5 to 23/3 a day according to rank (£117 to £424 a year)

The above rates of allowances apply to Home Commands only At certain stations abroad the rates are considerably higher

Candidates who have held a full-time house appointment in a recognized civil hospital before appointment to a permanent Commission in the R A M C may, subject to certain conditions, be allowed to count the period of service in such an appointment, up to a maximum of 12 months, as Army service for promotion, increase of pay, and retirement

Gratuties on Retirement—After 7 years' service as a medical officer £1,000
" 15 " " " " £2,800
" 18 " " " " £3,500

Current rates of retired pay range from £352 10s per annum, normally earned by a Major after 20 years' service, to £890 per annum, the maximum for which a Major General is eligible The rates of pay and retired pay are subject to revision on or before April 1st, 1934

Outfit Grant.—An officer on joining receives £50 as outfit allowance

Married Officers' Allowances—Officers of 30 years of age and over who are married are entitled to draw special rates of allowances

A Voluntary Widows' and Orphans' Fund exists for officers of the Corps

All particulars may be obtained by application, in writing or personally, to the Assistant Director-General Army Medical Services, The War Office, Whitehall, London, S W 1

COUNTY COUNCIL OF MIDDLESEX
NORTH MIDDLESEX COUNTY HOSPITAL, EDMONTON

RESIDENT PHYSICIAN

The County Council invites applications for the above appointment Candidates must be registered Medical Practitioners, Graduates in Medicine of a British University, and Fellows or Members of the Royal College of Physicians The successful candidate will work under the direction of the Medical Superintendent will reside at the hospital and will devote the whole of his time to his official duties.

The appointment is for one year but is renewable annually on application, for two further periods of one year

Applications should arrive at the Hospital not later than by the first Post on Saturday October 14th

Further particulars may be obtained from the House Governor

ARTHUR G ELLIOTT
House Governor

long been recognized, and its use by reputable firms is now abandoned In Germany it has been prohibited for the last forty years Mayer reports that in Japan the poorer women still use pure lead acetate as a powder and breast fed children have acquired chronic lead poisoning by inhaling it from their mother's skin Barron and Habein give a startling account of five cases of lead poisoning in one family including three deaths two of which were due to lead encephalopathy Only the women of the family were affected, and though the source was not absolutely certain, there was strong presumptive evidence for the prolonged use of a face powder containing lead acetate Bismuth is another metallic powder ingredient which may be harmful if absorbed in sufficient quantities Cole quotes Tuttle as reporting five cases of chronic poisoning due to an insoluble preparation of bismuth in a toilet powder Apart from lead and bismuth toilet powders appear to cause no harm except to individuals who are allergic or hypersensitive Eosin for instance which is used to colour powders causes dermatitis in some few people and orris root is a not uncommon allergen which may give rise to asthma or hay fever as well as dermatitis Rice, wheat and corn flour have also been incriminated as allergens

Lipsticks —These consist of a varying mixture of paraffin lanolin and spermaceti with a dyestuff They scarcely ever cause irritation The rare case of cheilitis from this source is generally due to the dye, and disappears as a rule with a change of lipstick

Cold Creams —These are mixtures of fats and water, with or without the addition of other ingredients The quality depends on the fineness of division of the fats—hence the superiority of proprietary mixtures Some face creams, however contain in addition lead or mercury in the form of white precipitate or calomel Woltman describes a case of chronic lead poisoning due to the use for twelve years of 'owl enamel cream' Creams and lotions containing perchloride of mercury in strengths up to 1 in 200 and white precipitate as strong as 50 per cent are recommended by so called beauty experts' as skin bleaches, the strength of the official white precipitate ointment is 5 per cent Their persistent use has been known to cause a facial pigmentation very difficult to remove Goeckermann mentions two such cases which he believes to have been associated with alkaline sweat He suggests that the normal acidity of the sweat might account for the rarity of this result

Many cosmetic advertisements to day lay stress on the radio active" properties of the wares extolled In the vast majority of cases this is fortunately a fraudulent statement for as Lord Lee of Fareham pointed out recently, in the Silvanus Thompson Lecture such substances, 'to such extent if any as they contain radium must be harmful and potentially dangerous He adds that in his view 'the sale of radio active preparations designed for either internal or external use should be absolutely prohibited"

Vanishing creams are relatively fatless creams and are composed of potassium or sodium stearate and glycerin together with a little fat and rose water or perfume Semi fatless creams may contain almond oil wax or gelatin Casein an occasional constituent of vanishing creams, may produce allergic reactions

Depilatories —Barium sulphide is the commonest constituent but sulphides of calcium, sodium, strontium or magnesium are also used These appear to be generally harmless but in sensitive skins they may give rise to a localized dermatitis

Wrinkle Removers —Astringent lotions are sold for this purpose They are as harmless as they are ineffective Some years ago there was a vogue for the local injection of paraffin Such injections are liable to cause fibrosis with lymphatic blockage and local oedema and in any case the aesthetic effects are most uncertain The method has been abandoned Miller and Faussig describe the appalling results of a third method of removing wrinkles This consists in painting the face with a 65 per cent solution of phenol Strips of adhesive tape are applied next day and removed forty eight hours later together with the adherent epidermis The crust separates in two to three weeks In the resulting scar wrinkles are not apparent Unfortunately it is impossible in some cases to close the lips or approximate the eyelids!

Hair Dyes —These have been grouped as (1) Vegetable dyes such as henna Henna does not irritate but its frequent use makes the hair brittle (2) Metallic dyes Silver copper mercury lead nickel, cobalt and bismuth are used in dilute solutions The metal combines with the sulphur in the hair to form a deposit of metallic sulphide If the metallic dyes are used frequently the metal will be to some extent absorbed and will give rise in time to symptoms of chronic poisoning, a much more serious sequel than the dermatitis of the scalp which may appear at the time of application (3) Compounds of metallic salts and vegetable products such as pyrogallic acid In these not only the metallic salts but also the pyrogallol are potentially toxic and irritant (4) Aniline derivatives of which the best known is paraphenylendiamine The aesthetic advantage of this dye is that it does not merely coat but penetrates the hair It is easy to apply gives a fast colour, and can produce a very varied range of shades For these reasons it became rapidly popular As its popularity spread its danger soon became manifest Its unrestricted sale is now prohibited in Germany Austria and France This dye causes a very severe and persistent dermatitis probably the most persistent of the dermatites due to external applications Miller and Faussig report a case where the eczematous lesions lasted for six months Not only is 'para' an irritant of the skin but it may also produce gastro intestinal and nervous symptoms including retrobulbar neuritis Several fatal cases have been recorded The client's sensitivity to the dye can be estimated beforehand by the Sabouraud Rousseau test But some hairdressers presumably owing to carelessness in application or observation, have failed to detect sensitivity, with disastrous results Several cases have recently been reported of poisoning from 'meeto" a popular preparation containing paraphenylendiamine Unfortunately this does not complete the list of irritants in the process of hair dyeing The first step in the process consists in the removal of the sebum This is usually done by applying an alkaline wash, such as caustic soda or ammonia after the shampoo If the alkaline wash is too strong it may produce a dermatitis of the scalp When the hair has already been dyed or has been unsatisfactorily dyed it may be necessary to remove the dyestuff by bleaching This may be done with hydrogen peroxide which does not irritate, but its excessive use may injure the hair shaft and cause the hairs to break off short Other substances used for hair bleaching are oxalic acid and hydrochloric acid the danger of which need hardly be stressed More disturbing still is the employment for this purpose of potassium cyanide

Hair Lotions —Cases of dermatitis or chronic intoxication have from time to time been traced to the use of hair lotion The incriminated substances have been quinine salicylic acid and resorcin These while beneficial in suitable strengths may cause dermatitis if given in too great strengths or to sensitive individuals Resorcin has the added drawback of causing a dirty discoloration of white or blonde hair Cole describes a case of dermatitis due to arsenious oxide given in a hair tonic Sir Thomas Oliver records a case of asthma which came and went with the use or abandonment of a hair wash containing lead

DISCUSSION

Such a formidable record of injurious effects might well lead one to condemn cosmetics outright This is often and unfortunately done I say "unfortunately" because the result is rarely to deter people from their use but rather to drive them into the hands of unqualified and ignorant or even of definitely fraudulent, persons It seems a pity, therefore, that cosmetics should sometimes be condemned by the medical profession as wholly injurious, not only for their chemical constituents but also for their physical properties, on what appear to be very insufficient grounds

McKenna, in an article in the *British Medical Journal* states that cold creams and vanishing creams "block the sebaceous and sweat glands," and that their use lead eventually to acne rosacea and acne vulgaris This is a common indictment But is there any proof of its validity? McCafferty and Genovese experimented on twenty five cases, and were unable to detect clogging of

the pores in any one McKenna ridicules the cleansing properties of cold cream which are so often advertised But if any observer will apply cold cream to the face and then rub it off with cotton wool he will find that the cream has removed a considerable layer of dirt and dust—more in fact than can be removed with a damp sponge or towel McKenna further dismisses the use of creams and skin foods on the ground that with the exception of glycerin none of the usual constituents are absorbed But Sutton's experiments have shown that fats *are* absorbed though in very varying degrees McKenna would apparently confine the toilet of the face to the use of soap-and water He says that it is only in exceptional cases that the skin of the face is irritated by toilet soaps if we exclude the cheaper soaps containing coco-nut oil and an excess of free alkali This is by no means a universal experience McCafferty and Genovese in addition to their tests with cold cream made further tests with soap They chose patients with moderately dry skins and observed the effect of a few weeks use of soap-and water on the face They found that mild desquamation appeared with a feeling of tautness This disappeared with the application of cold cream They conclude very reasonably that soap-and water are suitable for oily skins and cold cream for dry skins Vanishing creams they condemned as of no value on the ground that these creams were only used as a basis for powder and the same purpose could be served equally well by cold cream From an aesthetic point of view this is not quite true The fatty nature of cold creams makes them too shiny for use by day and it is for this reason that women dislike them

An Experiment with Vanishing Cream

There is however a popular feeling that vanishing creams are drying On theoretical grounds it would seem possible that their high glycerin content might prove irritating As I could find no statements on the subject I tested them myself Trials were made with forty individuals mostly girl undergraduates and a few older women Pond's vanishing cream was rubbed into the right side of the face at night and rubbed off in the morning The other side of the face was left untreated and used as a control The duration of the tests was from four to six weeks in April and early May a period in which many women notice a temporary roughness of the face generally attributed to spring winds The results were as follows

In twelve cases the untreated side of the face became rough while the treated side remained smooth
In one case both sides desquamated but the untreated side was the rougher
In one case both sides desquamated equally which was rapidly cured by cold cream
In one case only the treated side desquamated
In one case small pustules appeared on the treated side
In twenty four cases there was no change

In fact in twenty four cases vanishing cream proved harmless though three of these cases had naturally dry skins In thirteen cases the cream was beneficial In only one out of forty cases did the cream cause dryness

The use of cosmetics is looked upon more kindly on the Continent than in Great Britain In contradistinction to such criticisms as those of McKenna we have the opinion of Kromayer that salves and pastes and the like cause no change in the skin that can produce a bad cosmetic effect Sabouraud goes further and says that he would almost prefer bad creams and bad cosmetics to none at all He has noted as have many others that actresses as a class look younger than their contemporary sisters One sometimes hears the complaint that it is unnatural to put creams and lotions on the skin but it is equally unnatural to wash off the natural oils with soap-and water We live in dry warmed houses and expose the skin to sharp alternations of heat and cold Is it not to be expected that it should need protection and re-oiling?

THE TREATMENT OF ABSCESS OF THE BREAST*

BY

HAMILTON BAILEY F R C S

SURGEON ROYAL NORTHERN HOSPITAL CONSULTANT SURGEON ESSEX COUNTY COUNCIL

Although great strides have been made in preventing infection of the lactating breast mammary abscess is still an everyday occurrence For many years teaching concerning the treatment of these abscesses has remained stereotyped Under the well known principle of awaiting for fluctuation or at any rate until localization has occurred and then obtaining free drainage by incisions radiating from the nipple results in the majority of cases are good The objections which can be raised to this well tried method are mainly these (1) the resulting scars are too often unsightly (2) a proportion of cases continue to discharge for weeks or months (3) the dressings if secondary infection is to be minimized require the frequent attention of a skilled nurse About two decades ago an innovation was introduced Briefly it consisted of an early but small incision followed by suction with a Bier's hyperaemic bell I saw something of this method and the pain which it caused and the results which ensued were such that I gladly returned to the methods of our forefathers The method of treatment which presently will be described is free from all the objections of its forerunners

Most abscesses of the breast are of the intramammary variety (as opposed to subcutaneous or retromammary) and it is lactating women who are usually sufferers Infection occurs in one of two ways (1) Staphylococci enter the lactiferous ducts and cause clotting of the milk Within the clot these organisms multiply and the acini severed by the obstructed duct become the seat of a lively inflammation (2) Streptococci enter through a crack or abrasion of the nipple and inflammation proceeds apace in the interglandular tissues Unless it is arrested the infection spreads to the glandular mechanism Even

* Being part of an address to the Swindon Division of the British Medical Association February 22nd 1933

INDIAN MEDICAL SERVICE

Recruitment of European Officers.

Applications are invited from medical men for permanent commissions in H.M.'s Indian Medical Service. The terms offered include a gratuity of £1,000 on retirement after six years' service, or £2,500 after 12 years' service, together with free return passages for those who no longer desire to remain in the Service. In other respects the terms will be as detailed below.

Candidates must be European British subjects under 32 years of age at the time of application and must be registered under the Medical Acts in force in Great Britain and Northern Ireland.

CAREERS

The Indian Medical Service offers wide opportunities of medical experience including clinical preventive specialist and research work. At the beginning of his career an officer is employed on the military side which has medical charge of the Indian Army. Promotion is on a time scale up to the rank of Lieutenant-Colonel and by selection to the ranks of Colonel and Major-General. An officer may apply after one year's Indian Service to have his name registered for transfer to the civil side from which appointments are made to Civil Surgeoncies which are established at the principal civil centres to provide for the medical needs of civil officials and for general medical administrative purposes to specialist (for example public health and bacteriological) services to research posts and to professorships at the Medical Schools.

NOTE.—It is not possible to state at present what, if any, prospects of employment on the civil side will be open to Indian Medical Service Officers under the proposed new constitution for India.

PAY

Owing to the state of the financial emergency at present prevailing in India the existing monthly rates of pay which are as follows are subject to a temporary reduction of 5 per cent.

Rank	Service in Rank.	Basic Pay	Overseas Pay	Year of Total Service
		Rs.	Rs.	
Lieut.	—	500	100	1st.
			100	2nd.
			100	3rd.
Capt.	(i) During first 3 years service as Captain	600	100	4th.
			£15	5th.
			£15	6th.
	(ii) With more than 3 and less than 6 yrs. service as Captain	750	£25	7th.
			£25	8th.
			£25	9th.
	(iii) With more than 6 years service as Captain	850	£25	10th.
			£25	11th.
			£30	12th.
Major	(i) During first 3 years service as Major	900		
	(ii) With more than 3 and less than 6 years service as Major	1100		
	(iii) With more than 6 years service as Major	1250		
Lieut.-Col.	(i) Until completion of 23 years total service	1,000	£30	17th and over
	(ii) During 24th and 25th years service	1800		
	(iii) After completion of 25 years total service	1,000		
	(iv) When selected for increased pay	1250		

EXTRAS.—In addition to the above rates various allowances are admissible for a large number of special appointments on both the military and the civil side which may be held by members of the Indian Medical Service. Special high rates of pay are also attached to the numerous administrative appointments open to officers in both branches of the Service.

ANTEDATES IN COMMISSION

Any service rendered by an officer during the war as a medical or combatant officer or in a position usually filled by an officer may be counted as service for increments of pay promotion retirement and retired pay but not for gratuity.

One half of any service in the ranks during the war may be counted as service for retirement and retired pay only.

Candidates possessing certain higher medical qualifications may be granted an antedate of one year in their commissions. Past service in certain hospital appointments may also render candidates eligible for an antedate of one year. Persons holding or about to hold resident posts at recognized hospitals may be seconded in those posts for a period not exceeding one year. The maximum period of antedate secondment or antedate and secondment combined admissible under this paragraph is limited to one year.

OUTFIT ALLOWANCE.

Officers on appointment will receive an allowance of £50 towards the cost of outfit.

PRIVATE PRACTICE.

With the exception of Administrative Officers military or civil and officers holding certain special appointments officers are not debarred from taking private practice so long as it does not interfere with their proper duties.

LEAVE

Leave can be taken at reasonable intervals and adequate rates of leave pay are provided. Extra leave (known as study leave) which may not exceed 12 months in all during an officer's service may be granted to officers desirous of pursuing special courses of study of a post-graduate nature. During such leave study allowance at present fixed at the rate of 12s. a day in the United Kingdom £1 a day on the Continent of Europe and £1 10s. a day in the United States of America is granted to an officer in addition to ordinary rates of leave pay.

PENSIONS

The rates of pension are as follows	Per annum £
After 17 years service for pension	400
18	430
19	460
20	500
21	540
22	580
23	620
24	660
25	700
26	750
27 —	800

These rates are subject to alteration on account of a rise or fall in the cost of living as compared with the year 1919 to an extent not exceeding 20 per cent. in all. At present a reduction of 8¼ per cent. is being made on this account.

There are additional pensions ranging from £65 to £350 per annum for officers who have held administrative appointments.

PASSAGES.

An officer on appointment is provided with free passage to India. The families of officers who are married prior to the date of the officer's embarkation on first appointment will also be provided with free passage to India subject to the payment of messing charges.

Officers and their families are also eligible for passage concessions under which they are granted a certain number of return passages home at Government expense during their service.

INSTRUCTION PRIOR TO EMBARKATION

Officers are required to undergo courses of instruction at the Royal Army Medical College and at Aldershot lasting approximately six months prior to their embarkation for India on first appointment. Information as to the rates of pay admissible during this period and subsequently up to arrival in India is contained in the memorandum referred to below.

A memorandum giving full details regarding these appointments and forms of application may be obtained from the Under-Secretary of State for India, Military Department, India Office, London, S.W.1. The Selection Committee will meet at the India Office early in July next and the selected candidates will be required to join a course of instruction commencing early in August prior to sailing for India early in 1934. Applications should be submitted as soon as possible.

ROYAL VICTORIA INFIRMARY, NEWCASTLE UPON TYNE

RESIDENT APPOINTMENTS

The following Resident appointments will become vacant as from Tuesday, August 1st

The appointments are tenable for six months except the Skin and Venereal Departments and the Out patient Dressing Department, which will alternate for three months in each Department.

Applications, together with copies of three recent testimonials, will be sent to the undersigned not later than July 1st.

PHILIP INMAN, House Governor.

Charing Cross Hospital, London, W.C.2.

(Appointments continued on p. 60.)

Convalescence.—The only dressing now required is a piece of dry folded gauze over the wound kept in place by adhesive plaster. The patient can get up wearing an ordinary brassiere for support. There is always a considerable indurated area in the breast at this period and it persists for some time. Latterly I have placed the patient during convalescence upon iodine in milk therapy similar to that described by Mr. H. Chitty for the treatment of actinomycosis. This has been followed by a more rapid absorption of the massive induration and an obvious improvement in the patient's general condition.

Conclusion

I submit that this technique which largely follows that of Dr. J. E. Hobbs of St. Louis is an advance on older methods. After a considerable experience of it I am confident that those who adopt the method will find that the patient is delighted with the painlessness of the post-operative period. Scarring of the breast is reduced to a minimum—obviously an important consideration. Convalescence is short—much shorter than when the classical treatment is employed. I have found that the after-treatment has received the unqualified approval of the attending nursing staff, and it seems probable that the method will appeal particularly to the more isolated practitioner who of necessity must leave the after-treatment largely in the hands of a district nurse.

A TREATMENT OF SYDENHAM'S CHOREA

BY

DONALD BATEMAN, M.R.C.S., L.R.C.P.

HOUSE PHYSICIAN, HOSPITAL FOR SICK CHILDREN, GREAT ORMOND STREET.

The treatment of Sydenham's chorea as conducted at present may be said to resolve itself into enforced rest and the use of drugs. The most popular drugs for this purpose are probably salicylates, aspirin, chloretone, arsenic and nirvanol. Although much can be said in favour of the use of nirvanol there are those who raise objection to it and who state that harmful effects may arise from its administration even when the greatest care is taken. Of the others none is of proven and specific value in the treatment of this disease. Rest is the fundamental and most important mode of treatment; the drugs play a secondary part. It is almost impossible to secure complete rest in the patient's own home, especially is this so when dealing with the hospital class of patient and it is among this class that the disease is most prevalent. Moreover rest to be effective must be prolonged. The result is that we have throughout the country large numbers of cases of chorea occupying beds for extensive periods in the hospitals supported by voluntary contributions. If there could be discovered a satisfactory method of treatment that would bring about a quicker cure it would be a source of great economy and convenience as well as of satisfaction to the patients' parents. The possibility that there is such a method has now been demonstrated with success by Dr. Lucy Porter Sutton of Bellevue Hospital, New York City. It was observed by her that an intoxication with fever resulting from phenobarbital therapy, when occurring in a case of chorea caused a reduction in the choreic manifestations. The conclusion was drawn that the fever itself was responsible for the effect. On this basis it appeared that the deliberate provocation of fever during the course of an attack of chorea would be a beneficial therapeutic measure. This proved to be so. The induction of fever is now used as a routine procedure in the treatment of chorea in the Children's Medical Service of the Bellevue Hospital. It is upon the observation of Dr. Sutton's methods and the experience derived from a number of patients with chorea whom it was my privilege to treat under her direction that this report is made.

Treatment by Induced Pyrexia

Fever is induced by a triple typhoid vaccine containing 1,000 million typhoid and 750 million each of paratyphoid A and B bacilli per cubic centimetre. Other methods of causing artificial fever have been used and are at present being investigated but the typhoid treatment is at present most commonly employed. The routine is as follows.

On the day following admission to hospital the patient is submitted to a thorough physical examination to make sure that there are no contraindications to treatment. The degree of chorea exhibited in the various limbs at rest and upon the performance of combined movements (walking, dressing, mastication) is estimated and classified as severe, moderate or mild; this is done so that the daily progress may be roughly noted. It should be carried out each day before treatment. On the day treatment is commenced the patient receives a light breakfast (that is, no food within a short time of the induction of fever). The pulse and temperature are taken immediately before the typhoid vaccine injection. It is advisable to take the temperature rectally as it is hard to estimate it accurately elsewhere once the fever is in progress. The vaccine is administered intravenously. It is customary to begin with 0·05 or 0·1 c.cm. as a reasonably high temperature is usually obtained with fairly small doses following the initial injections. The patient is then placed in a blanket bed and is supplied with several hot water bottles. It must be emphasized that the patient requires the most careful observation and attention from the nursing and medical staffs during the course of the fever. The desired object is the attainment of a temperature between 104° F. and 105·5° F. and its maintenance for four hours. At first it should be taken hourly, but once it is above 103° it is as well to take it every thirty minutes. The only objection to the temperature being taken frequently throughout the treatment is that each disturbance of the bed tends to lower the patient's temperature. Once the temperature is rising well it is advisable to remove the hot water bottles.

During the course of the treatment the patient's thirst may be relieved by sips of water; copious draughts should not be allowed as they may be harmful and also have an antipyretic effect. No food should be given, even without it vomiting may occur in a few cases. The earlier after injection the required degree of fever is reached the more likely is the temperature to go on rising. In these cases it is necessary to remove some of the bedclothes until the next temperature is read. The patient should be carefully watched. At the end of the period of desired hyperpyrexia the patient is placed between sheets and the temperature allowed to fall. But this is not an occasion for the relaxation of nursing attention. The temperature should be taken regularly until it is normal again. If it rises above 106° efforts should at once be made to bring it down. The bedclothes should be removed and the patient covered only with a sheet. A tepid sponging should be given and aspirin (5 grains) administered. In addition an ice bag may be applied to the head. The tepid sponging should be continued at intervals of a few minutes until the temperature is below 106°. It is not usual for it to reach this height but if it does harmful effects do not ensue. 106° is used as an indication for active measures as it is well inside the limits of safety. If the patient has been carefully watched this degree of pyrexia should not be reached at all as it should have been possible to regulate the temperature by adjustments of the bedclothes based on previous observations. In this connexion it is important to note whether the patient is of a type that sweats easily or not. In those who do not sweat much the temperature is apt to rise fairly rapidly to a considerable height and close attention is therefore indicated. With patients who sweat easily there may be difficulty in getting the required temperature and they should be wrapped closely in their blankets when it is seen that the temperature

is not rising This measure may send the temperature up quickly, and the patient should be watched for this eventuality

The treatment should be continued each day until the choreic movements have disappeared It is usually found that the dose of typhoid vaccine must be doubled each day in order that it may be effective but no general rule can be made as patients react differently It is a good plan in starting to increase the dose by half that of the day before A rough guide is that it should be increased freely when the previous day's dose gave a poor result and only slightly when the former one was attended with a very high fever But even after a high fever a larger dose is usually necessary if an adequate fever is to be maintained If it is found that a dose of vaccine has not been sufficient, it may be supplemented two to four hours later by another and smaller one

Most patients show a marked improvement after two or three treatments and are usually free from choreic movements in a week As would be expected the milder cases improve more quickly than the severe ones Patients with a long history of chorea before admission to hospital may be slow in their response to treatment and it should be remembered that in these patients habit movements may be superimposed upon those that are essentially of choreic origin At the end of the fever treatment the patients are kept in bed for a few days and are then allowed up for a week before discharge from hospital The usual length of stay in hospital is three weeks This compares very favourably with the seven weeks which most other modes of treatment require Mention may be made of those cases of chorea which on admission to hospital show a cardiac murmur of rheumatic origin This need not be regarded as a contraindication to treatment unless it is thought that the circulatory system cannot support the effects of a high fever The treatment so far has proved satisfactory It has considerably shortened the duration of the stay in hospital and is not accompanied so far as is at present known, by complications The patient's discomfort attendant upon the treatment is much less than might be expected and is probably preferable to the weeks in bed and long continuance of the choreiform movements associated with other methods

I have to thank Dr Charles Hendee Smith and Dr Lucy Porter Sutton of the Children's Medical Division Bellevue Hospital New York City and the Department of Paediatrics New York University for allowing me to treat cases under their direction for teaching me their methods and for permitting me to write this note

Memoranda

MEDICAL, SURGICAL, OBSTETRICAL

POST OPERATIVE INTESTINAL OBSTRUCTION

A case reported by Mr A Davies under this heading in the *Journal* of January 7th was interesting and helpful The following case which came under my care involved a similar sequence of problems, but with variations

The patient aged 10 was admitted to the St Albans and Mid Herts Hospital on November 6th 1930, with the history that for three days she had had abdominal pain with vomiting

On November 7th an appendicectomy was performed The appendix was found to be ulcerated but not perforated and the abdomen was closed without drainage Subsequent progress was uneventful and the patient was discharged as fit fourteen days later

On February 28th 1932 the patient was re admitted with a history of sudden onset of abdominal pain on the previous day frequent vomiting and pain on micturition temperature was 101° and pulse 146 On examination there was no abdominal distension but rigidity and tenderness especially in the right lumbar and right iliac regions A laparotomy was performed that evening and a nine inch loop of small intestine was found constricted by an adhesion The constricting band was incised and the gut which was dark purple in colour on being treated with warm saline so improved in appearance as to be considered viable The abdomen was closed without drainage During the following three days the patient's condition was satisfactory the temperature fell gradually to normal on the third day and the pulse rate decreased Much abdominal pain with occasional vomiting, was not considered abnormal Anti gas gangrene serum was given with morphine and heroin and on the third day an enema was administered with good result and passage of flatus On the fourth day blood and mucus was passed per rectum vomiting increased in frequency and became faeculent and the abdomen became more distended An exploration was undertaken and the affected loop of bowel was found to be gangrenous and perforated The pelvis was full of foul intestinal contents which welled out of the abdominal wound A Paul's tube was inserted into the healthy gut proximal to the gangrenous portion the latter being brought into the lower margin of the wound and left *in situ* the pelvis was drained Resection was considered inexpedient in view of the condition of the patient but especially in view of her age Subsequently the ileum drained freely through the enterostomy, the wound gaped widely and ten days later the segment of bowel together with its mesentery separated through the lower extremity of the wound

On April 19th a further operation was undertaken the skin of the abdominal wall having become severely excoriated by the digestive action of the ileal contents There was an extensive 'matting' between coils of gut The ileum above and proximal to the enterostomy was clamped and divided the distal end invaginated, while a lateral anastomosis was performed between the proximal portion of ileum and the transverse colon On April 22nd the bowels opened naturally The patient was again discharged on June 4th both the local and the general condition being very favourable

After re admission three months later the functionless enterostomy was closed by dissection and invaginated extraperitoneally and the patient finally discharged on October 29th

This case demonstrates, as did the one previously recorded, the difficulties of diagnosis in surgical conditions of the abdomen In the interim between the initial operation for intestinal obstruction and the following exploration, the patient's general condition was no criterion of the pathological state The case also illustrates the inherent faculty of the peritoneum to procure the restoration of vital functions This has been the only case in my experience of the separation of a segment of gut together with its mesentery by natural means and its extrusion through the abdominal wound

D S MORGAN JONES F R C S Ed
Honorary Surgeon St Albans and Mid Herts Hospital

P S —Since the above was written the recurrent formation of a mucocele necessitated a complete resection of the blind gut, which was undertaken on March 7th with an entirely successful issue

A CASE OF GENERALIZED VACCINIA

Although, after vaccination, secondary pustules are sometimes seen round the primary mark a case of generalized vaccinia is comparatively rare

On December 1st 1932 I vaccinated D H a well nourished healthy baby weighing 15 lb and aged 3 months using Government establishment lymph and making one scar on the left arm At the same time I vaccinated an older child H H, aged 10 years in the same house using the same lymph On December 7th I inspected both arms and found them clean and healthy presenting the features of a normal six day vaccination On December 20th the medical officer of health asked if I would call and see the younger child as some spots had broken out over the body

When I saw it I learned that the spots had begun to appear about three days previously The outer surface of the left arm was bright red the colour extending from 1 inch below the shoulder to about 1½ inches above the elbow The area was covered by necrosed skin and presented the appearance

FOR SALE, OWING TO LEAVING PRACTICE. EXAMINATION COUCH INSTRUMENT CUPBOARD Midwifery and other INSTRUMENTS Excellent condition Low price for quick sale—Dr GREAVES 14 Escrick Road, Bilbrough Yorks.

of a large blister out of which the fluid had been withdrawn There was a very slight temperature (99° F) The child was restless fretful and irritable and refused its food On the wrists thighs legs and head there were raised pearly spots in varying stages of development and of various sizes Some were umbilicated and some appeared more like the spots of alastrim than those of small pox On December 21st the child was admitted to Fazackerly Hospital under the care of Dr C Rundle the medical superintendent On admission there were numerous small vesicles around the original larger one on the left arm and the spots on the body had developed into typical vaccination pustules The distribution was then face back of scalp both wrists left thumb right buttock and several on the right leg and thigh and soles of both feet The temperature was still 99° pulse 132 respiration 34 On December 23rd the temperature went up to 100 4° The pulse was 144 and the lesions were spreading with copious eruption on both legs and buttocks and on the face some of these were the size of a shilling The temperature then fell to normal and remained so until December 26th On December 25th fresh pustules developed on the back and front of both thighs but with no accompanying rise of temperature On December 26th the temperature again rose to 99 6° and the arm became very baggy and was inclined to slough There were numerous water vesicles at the outer edge The child was taking food well On December 27th the temperature rose still further to 100 4° pulse 178 and the child developed convulsions and died

The post mortem findings were as follows The body was that of a well nourished child Over the outer surface of the left upper arm was a bare bright red inflamed area 4 inches long by 3½ inches in diameter and extending approximately from the shoulder to the elbow There was some deeper coloration of the central portion suggesting that this was the oldest part of the lesion and that it had commenced there The body was covered with raised pearly spots varying from about 1 8 inch up to 1 2 inch in diameter The larger of these were depressed in the centre and had thickened edges resembling blebs and giving the appearance of developing vaccination pocks The largest and oldest lesions showed necrosis in the centres and the formation of crusts There was little or no pustulation The distribution of the lesions was general but they were more numerous on the lower limbs than on the trunk and upper part of the body The thoracic organs were healthy except for some terminal congestion and oedema of the lung bases The liver and spleen both showed areas of necrosis having the characters of vaccinia lesions The other abdominal organs showed no abnormality Microscopical examination of the skin lesions showed these to have the character of vaccinia papules The same characters were found in the focal lesions of the spleen and liver No changes of importance were found by microscopical examination in the brain and spinal cord or in the other organs (suprarenals heart kidneys pancreas) which were examined in this way

It is obvious from the pathological report that this was a blood borne infection Professor Dible pathologist of Liverpool University has never seen a case of this kind in his experience It could hardly have arisen from any septic infection as both parents and home were extremely clean and there was no evidence of such infection being present While I was in Persia several thousand vaccinations were done either by me or under my supervision The scar was made and the lymph was allowed to dry on It was impossible to keep either pads or bandages on the natives arms so after drying they were left uncovered No untoward result had ever been seen I have had several letters on the subject and in one the writer has reported to me a case of general vaccinia which occurred in a baby that had been washed with water in which an elder child who had been vaccinated was bathed

I am deeply indebted to Professor Dible for a report on his post mortem and bacteriological findings and to Dr C Rundle medical superintendent Fazackerly Fever Hospital for his notes on the case whilst it was under his care

Reports of Societies

OVARIOTOMY

At the annual general meeting of the Section of Obstetrics and Gynaecology of the Royal Society of Medicine with the president Mr J P HEDLEY in the chair Dr HERBERT SPENCER in a review of six hundred and fifty eight ovariotomies remarked on the paucity of *personal* records of complete series since Spencer Wells published in 1882 his *One Thousand Ovariotomies* with a mortality rate of 23 2 per cent Dr Spencer had published his first fifty cases (in 1893) with one death but in his complete series there were thirty five deaths (5 3 per cent) of which twelve occurred after the removal of malignant or suppurating tumours

Dr Spencer emphasized the importance of the entering of particulars in an analysis book by the operator immediately after the operation and recovery or death of the patient No patient was discharged from hospital or home before the twenty fourth day after operation As an illustration of the influence on statistics of early discharge from hospital or home he stated that of the thirty five deaths one occurred (from syncope) on the twenty second day two (from embolism) on the twenty fourth day one (malignant) on the thirty fourth day and one (from cachexia) five months after operation The youngest patient was aged 14 the oldest 82 eleven patients being over 70 years of age Sixty three cases associated with pregnancy had been already published in detail Adhesions were present in 448 cases torsions of the pedicle in eighty-five twelve tumours had been tapped before operation There were thirty three benign ovarian tumours (in addition to seventeen malignant cysts) which were papillomatous sixty six were dermoids twenty ovarian fibroids (eighteen fibromata two adenofibromata) forty five were parovarian tumours (eight complicating pregnancy) sixty three tumours were suppurating sixty seven malignant (of which six were sarcomata and two endotheliomata) The proportion of malignant tumours was just over 10 per cent Dr Spencer thought that the proportion (20 to 25 per cent) often stated in textbooks was exaggerated and that the error was due to mistaking benign for malignant papilloma and fibroma for sarcoma He had personally removed eleven papillomatous benign ovarian tumours which after coeliotomy had been declared by experienced gynaecologists to be inoperable and mostly malignant and as a result of a personal experience of this kind if a patient with a tumour supposed to be malignant was found to be in fair condition two years later he advised the operator to believe with him that a mistake had been made and remove the tumour In Dr Spencer's opinion all benign tumours could and should be removed With regard to malignant tumours he was of the opinion that many of these could be removed with advantage even in presence of secondary growths Cases in support of this opinion were mentioned such as cancerous tumours remaining well six and seven years after unilateral removal a patient well four years after removal of cancer of the ovary and breast and a patient with pseudomyxoma ovarii et peritonei who survived four operations and died of heart disease seventeen years after the first operation A notebook with details of the cases was exhibited

Lieut.-Colonel GREEN ARMYTAGE reminded the Section that he had published in 1930 the findings and results of 547 consecutive operations for ovarian neoplasms He was of opinion that the incidence of malignancy was greater than Dr Spencer had indicated (10 per cent) for in his series microscopically malignant tumours amounted to 21 4 per cent a figure which approximated more nearly to the statistics of Döderlein and Lippert He considered also that the chances of recurrence in the opposite ovary in cases of papilliferous tumours was greater than Dr Spencer had suggested In recent years when there was ascites and an extrinsic type of papillary tumour in one ovary he had preferred to remove the uterus and both ovaries With regard to pulmonary embolism he had found this accident a very rare com

plication in clean cases since he had insisted on breathing exercises and active limb and chest movements

Mrs IVENS-KNOWLES said that in a case of bilateral dermoids associated with a five months pregnancy, she had adopted the enucleation as recommended by Dr Spencer The pregnancy continued and menstruation returned normally Twenty years later however, carcinoma of the right ovary had developed This unfortunate sequel to a successful case had made her doubt the safety of the procedure Mr C D LOCHRANE stated that he had experienced the grave complication of pulmonary embolism in his cases in spite of deep breathing exercises and early active movements Dame LOUISE MCILROY and Mr CLIFFORD WHITE also took part in the discussion

Dr HERBERT SPENCER, in reply, referring to Colonel Green-Armytage's practice of removing both ovaries in cases of papilloma of the ovary said that the advantages of leaving one ovary, or even part of the organ, were so great that he preferred to take the risk of development of papillomata on the other side Dr Ivens-Knowles's experience would not affect his belief in the soundness of the practice of enucleating dermoids He did not agree with Colonel Green-Armytage that suppuration never occurred in dermoids he had met with it four times in sixty-six cases He would with Mr Lochrane, express his mistrust of facile statements about methods to avoid pulmonary embolism

SNAKE VENOMS

At a meeting of the Royal Society of Tropical Medicine and Hygiene on May 11th with the president Dr CARMICHAEL LOW in the chair, Dr C H KELLAWAY read a paper entitled "Some Peculiarities of Australian Snake Venom'

In his introductory remarks Dr Kellaway pointed out that, though Fairley (1929) had shown in the common poisonous Australian snakes a gradual transition in morphological characters from the non-poisonous colubrines towards the vipers, no such regular transition was demonstrable in their venom constituents, the death-adder for example, presenting a pure colubrine type of venom Viperine venoms were not so toxic as those of the Colubridae they, however, possessed powerful thrombins and usually killed by causing peripheral circulatory failure which was contributed to by cytolysis of vascular endothelium (haemorrhagin) Viperine venoms were weak in haemolytic and curare-like action The venom of the Colubridae, on the other hand generally possessed no thrombins, but contained powerful haemolysins and were predominantly curare-like poisons some had an additional direct action on muscle These venoms caused death by paralysis of respiration but the action was peripheral, and not central This he had demonstrated experimentally in inoculated animals by placing the phrenic nerve in contact with non-polarizable electrodes the upper of which was earthed and the lower connected to the grid of the first valve of an amplifier whose output passed to a loud speaker Rhythmic rustling sounds due to nervous impulses down the phrenic nerve were heard similar to those studied by Gasser and Newcomer (1921) and Adrian and his colleagues (1928) Certain of the Australian colubrine venoms were powerfully coagulent but haemorrhagins were not strongly represented Their haemolysins though generally similar in action to those of other colubrine venoms, exhibited certain points of difference They were not influenced by the presence of complement indeed, serum frequently inhibited instead of activating haemolysis The haemolysins though they caused inhibition of haemolysis when present in excess did not render the cells less susceptible to other lytic agents The Australian venoms were peculiarly toxic when administered subcutaneously, and though this was in part due to their curare like action it could not be wholly accounted for There was no convincing evidence of direct action on the central nervous system and their extreme toxicity might be due in part to action on the peripheral circulation On smooth muscle the Australian venoms exhibited a wholly peculiar action, which resembled the anaphylactic response of sensitive plain muscle Similar effects could be demonstrated upon the isolated uterine muscle and upon the intact vascular system The potency of this action on smooth muscle was closely paralleled by the lethal action of the venoms when injected subcutaneously in laboratory animals

Dr HAMILTON FAIRLEY referred to the pioneer work on snake venom done by Martin in Australia at the close of the last century and pointed out that until Dr Kellaway and his colleagues had commenced their investigations at the Hall Institute of Research Melbourne little new work had been done Apart from field work and investigations on ophidian immunity, Dr Kellaway had studied a number of entirely new Australian venoms, and re-investigated the commoner colubrine venoms, using modern pharmacological methods the end result had been to establish a very strong case for their peripheral action Essex and Markowitch had done this conclusively for the crotaline viper venoms and since the lesion described in the nervous system by Kilvington Lamb and others could now be explained in terms of asphyxia it looked as if the whole theory of the central action of venom would have to be discarded The killing capacity of the venom yield of certain Australian snakes was amazing and in Australia at one 'milking" he had obtained sufficient venom from a tiger snake to kill a flock of 387 sheep, and from the death adder sufficient to kill 235 , the average venom yield had been 118 and 84 7 lethal sheep doses for these two species respectively In studying snake venoms the zoological approach remained an important and an inadequately explored one After all, snake venom was fundamentally a digestive salivary juice, and the fact that it contained haemorrhagin, haemolysin, and other cytolysins and even thrombin, was not so surprising , but the capacity of the venom gland to manufacture a neuro muscular poison having the effect of rapidly immobilizing the prey was difficult to comprehend except in terms of a spontaneous variation which had become permanently established by natural selection More information was required about the physiology of ophidian digestion and the interrelationship of the digestive juices, and when this was forthcoming the significance of certain venom constituents might become more apparent

Dr MORGAN said that as director of the Commonwealth Serum Institute, he had been asked to produce antivenenes, and had succeeded in the case of the tiger snake and copperhead but not in the death adder Some 2 or 3 mg of the latter venom was the approximate lethal dose for horses, yet after immunizing them to stand as much as 8 grams of venom—that is, 2,700 lethal doses—the serum showed no obvious protective action Dr Kellaway had already referred to this finding in one of his papers So far no polyvalent serum was available throughout Australia, but in tiger-snake bites so treated fourteen out of fourteen cases had recovered Regarding specificity tiger-snake antivenene was only 10 per cent protective for the copperhead, and showed no protection at all for death-adder venom The action of antivenene was specific

Colonel R H ELLIOT stated that some thirty years ago he had started work assuming that all colubrine snakes killed alike but he had soon found that the action of the sea-snake was different from that of the cobra and its venom ten times more lethal In his experience *Tel s carinata* was not a deadly snake He asked whether in inoculated monkeys Dr Kellaway had observed paralysis of the levator palpebrae superioris, and in frogs paralysis of the muscles lifting the lower lids Sir LEONARD ROGERS said that he was not altogether convinced as to the peripheral action of the cobra venom which killed an animal in two to three minutes at a time when there was no paralysis of the phrenic nerve he did not think haemolysin had anything to do with mortality Prof. BOYCOTT asked whether venoms were adapted to the animals they were required to kill and whether they were always compound in their constitution Was any venom known which contained a single constituent, such as thrombin or haemolysin?

Sir HENRY DALE commented on the interesting nature of the diffusible thrombin of brown snake venom and

SOUTH DEVON AND EAST CORNWALL HOSPITAL PLYMOUTH
(240 Beds)

Applications are invited for the post of HOUSE PHYSICIAN
Salary £120 with board, residence, and laundry
Appointment tenable for six months and subject to renewal
Duties to commence July 1st
Applicants must be registered under the Medical Acts.
Applications stating age and qualifications with copies of three recent testimonials, to reach the undersigned by June 21st
ARTHUR R CASH
Gen Supt & Secretary

THE WILLESDEN GENERAL HOSPITAL, N W 10

OUT PATIENT DEPARTMENT
CLINICAL ASSISTANTS

Applications are invited for appointment to the following sessions
SURGICAL—Monday afternoons
MEDICAL—Tuesday afternoons
MEDICAL—Friday mornings.
SKIN—Saturday mornings.
DENTAL—
Applications must be received not later than first post on Monday June 26th and should be addressed to the Secretary of the Hospital from whom further details of the appointments may be obtained
June 12th 1933

WOLVERHAMPTON AND MIDLAND COUNTIES EYE INFIRMARY

HOUSE SURGEON wanted Ophthalmic experience preferred Duties to commence in July There are 50 beds for In patients and large Out patient Department Salary £150 a year with furnished apartments board and laundry Ladies and gentlemen applying should state age and experience and send copies of three recent testimonials to reach the Secretary not later than July 3rd
EUSTACE LEES
June 13th 1933 Secretary

ROYAL INFIRMARY BLACKBURN
(240 Beds—Five Residents)

FOURTH HOUSE SURGEON (male) required at a salary of £150 per annum rising to £250 with board residence laundry, etc To commence duties at end of June
Applications with copies of testimonials stating age nationality experience etc to be sent at once to the undersigned
Royal Infirmary NATHAN A SMITH
Blackburn Gen Supt & Secretary
This Institution is recognised for the Surgical Practice required for the F R C S final examination

BOOTHAM PARK MENTAL HOSPITAL, YORK

Wanted ASSISTANT MEDICAL OFFICER male single fully qualified and registered Previous Mental Hospital experience not essential Salary at the rate of £300 per annum with board accommodation attendance and laundry
Apply with copies of testimonials to the Medical Superintendent Bootham Park York

ECCLES AND PATRICROFT HOSPITAL
near MANCHESTER

HOUSE SURGEON required, July 15th Good general surgical work Commencing salary at rate of £150 p a plus usual Six months appointment Apply with copies of testimonials to the Secretary at the Hospital

WEST END HOSPITAL FOR NERVOUS DISEASES
In Patient Department Gloucester Gate, Regent's Park
Out Patient Department 73 Welbeck St, W 1

The Committee of Management invites applications for the post of HON ASSISTANT OPHTHALMIC SURGEON Candidates who must be Fellows of the Royal College of Surgeons Eng are requested to send eleven copies of their application, with recent testimonials not later than Monday June 19th, to the undersigned from whom further particulars should be obtained.
J P WETENHALL,
Welbeck Street W 1 Secretary

CENTRAL LONDON OPHTHALMIC HOSPITAL, Judd Street St Pancras W C 1

Applications are invited for the posts of SENIOR and JUNIOR HOUSE SURGEON Candidates must be registered Medical Practitioners Salary £120 and £100 per annum respectively with board and residence in the Hospital The appointments are for six months from July 15th. The Junior House Surgeon is a candidate for the Senior post
Applications, with copies of three testimonials should reach the undersigned on or before June 30th
GEORGE WATTS Secretary

TORBAY HOSPITAL TORQUAY
(146 Beds)

A HOUSE PHYSICIAN (male) is required for July 14th Salary £175 per annum, with board residence, and laundry allowance Candidates must be fully qualified, registered and unmarried
Applications stating age nationality qualifications and experience to be sent to the undersigned as early as possible with copies of not more than three recent testimonials.
E L GRIST
June 12th 1933 Secretary

THE CHILDREN'S HOSPITAL SHEFFIELD
(110 Beds—Three Residents)

Applications are invited for the following posts vacant August 1st
HOUSE PHYSICIAN HOUSE SURGEON
The appointments are for six months with salary in each case at the rate of £100 per annum with board residence and laundry
Candidates must possess registerable qualifications forward applications etc, together with copies of three recent testimonials to the undersigned
T H G GARTLAND Secretary

SANATORIUM, BRIDGE OF WEIR

COLONY FOR EPILEPTICS, BRIDGE OF WEIR

ASSISTANT MALE RESIDENT MEDICAL OFFICER wanted to commence duties in August
Keen evangelical and keen research worker preferred Appointment for six months in first instance at rate of £200 p a (renewable by mutual agreement) with board and laundry
Applications to Medical Superintendent stating age experience and qualifications and enclosing references

MERTHYR GENERAL HOSPITAL

Applications are invited for the post of RESIDENT SURGEON for the coming six months. Salary £150 per annum plus board lodging and laundry
Applications with three recent testimonials must be in the hands of the Secretary on or before June 24th

CITY OF LIVERPOOL

MEDICAL SUPERINTENDENT
MILL ROAD INFIRMARY

Applications are invited from fully qualified Medical Practitioners with the necessary knowledge and experience of hospital administration for the appointment of full time Medical Superintendent at the above Infirmary at a salary of £1 000 per annum (subject to a temporary deduction authorised by the Council) together with an allowance of £150 per annum in lieu of residence For the time being the appointment will be non resident but the Council reserve the right to call upon the Medical Superintendent to reside in the Infirmary when suitable accommodation is available Any fees received in connection with the appointment to be handed over to the City Treasurer in accordance with the Standing Orders of the Council
The gentleman appointed will assume control of the Infirmary under the direction of the Medical Officer of Health and be responsible for the work of the Medical Surgical Nursing and Administrative Staffs in accordance with the instructions of the Council from time to time Special experience in surgery is essential
The Infirmary accommodates acute medical surgical and maternity patients with approximately 800 beds and has a staff of Resident Assistant Medical Officers Visiting Specialists and a Nursing Staff of 130
The Infirmary is a Training School recognized by the General Nursing Council and the Central Midwives Board and the Medical Superintendent will be required to organise the necessary lectures in connection with the training of Nurses.
The appointment will be made subject to the Local Government and Other Officers Superannuation Act 1922 and the Standing Orders of the City Council and will be determinable by three calendar months notice on either side
Applications to be made upon forms to be obtained from the Medical Officer of Health Municipal Annexe, Dale Street Liverpool to be endorsed Medical Superintendent Mill Road Infirmary' and returned to the undersigned so as to be received not later than first post Tuesday, July 4th Canvassing of members of the City Council either directly or indirectly, will be considered a disqualification
Municipal Buildings, WALTER MOON
Liverpool Town Clerk
June 1933

HILL END MENTAL HOSPITAL
ST ALBANS HERTS

ASSISTANT MEDICAL OFFICER (THIRD) required early in July Male single age not over 30 years Previous Mental Hospital experience not essential Salary £400, rising to £450 per annum with furnished quarters board attendance and washing in addition £50 per annum will be paid upon obtaining the D P M The appointment is subject to the provisions of the Asylums Officers Superannuation Act 1909 At present a temporary economy deduction of 5 per cent on the salary is in force Application stating age qualifications and experience with copies of three recent testimonials to the Medical Superintendent

also asked if there was any evidence that a mush of plain muscle would absorb the venom constituent responsible for the anaphylactic like response of isolated plain muscle Sir RICKARD CHRISTOPHERS said that he would have expected snake-venom haemolysis to resemble saponin haemolysis and so be unassociated with prehaemolytic swelling of the corpuscle He asked what was the degree of dilution in which prehaemolytic swelling was seen Dr MALCOLM SMITH pointed out that the Ophidia were classified into three groups non poisonous snakes with non grooved teeth back fang snakes which possessed grooves on their back teeth and a mildly poisonous venom and the truly poisonous snakes with grooved or canalized front teeth and potent venoms From the evolutionary viewpoint the back fanged snakes with grooved teeth had gradually shortened their maxillary bone until the back has become the first fang

In replying Dr KELLAWAY dealt with the various questions raised With regard to Sir Leonard Rogers's criticism concerning the peripheral action of venom he pointed out that cobra venom was a cardiac poison and where many lethal doses were given the animal died of heart failure before curarization had time to develop He had noted with Australian venoms paralysis of the eyelids of monkeys and frogs similar to those described by Colonel Elliot for Indian venoms In regard to Sir Henry Dale's query he had not determined whether muscle could absorb the constituent of venom concerned in its anaphylactic like response but would do so In haemolytic experiments the order of dose producing strong prehaemolytic swelling varied from 1 to 3 mg for 0·34 c.cm of a 50 per cent suspension of corpuscles

TOXAEMIAS OF PREGNANCY

At a meeting of the London Association of the Medical Women's Federation held on May 23rd Professor M LUCAS KEENE presiding a paper on toxaemias of pregnancy was read by Miss MARGARET BASDEN She said that she proposed to discuss only late toxaemias—namely toxic albuminuria and eclampsia Following Dr James Young's classification she included all cases of albuminuria occurring in late pregnancy and drew attention to Dr Young's view that nearly every case of chronic nephritis met with in pregnancy owed its origin to toxaemia originating in a previous pregnancy The cause of toxaemia of pregnancy was still unknown but certain facts were established that the cause of toxaemia of pregnancy was pregnancy (G F Gibberd) that the organs chiefly involved were the liver and kidneys and that the latter might be permanently affected Miss Basden then gave some statistics for the years 1931 and 1932 from the Mothers' Hospital Clapton

Out of a total of 3,008 deliveries during this period there were 239 cases of albuminuria excluding eclampsia (7·9 per cent.) Fifteen per cent of the patients gave a previous history of scarlet fever or diphtheria but since many case sheets had no reference to past history the proportion of previous infective disease was probably higher The foetal mortality rate in the group was only 3 per cent and 73 per cent of the cases did not show symptoms till the thirty fourth week or later but it was possible that the infective disease had caused an occult nephritis The combined foetal and neo-natal mortality in all cases was 4·5 per cent and in the albuminuria cases 10 per cent High blood pressure in the mother appeared to play the most important part in causing foetal deaths—a blood pressure of 150 or over was present in 64 per cent of the cases and of 170 or over in 44 per cent Prolonged toxaemia was less important as a cause of foetal death and was present in less than 25 per cent

The supervention of eclampsia was no longer looked upon as the only real danger to the mother connected with toxic albuminurias for the work of Gibberd and others had shown that the albuminuria recurred as such in subsequent pregnancies in 50 per cent of cases while in 10 per cent of cases it recurred as chronic nephritis The risks both of recurrent albuminuria and of chronic nephritis were greatly increased when the toxaemia was allowed to continue for more than three weeks The diagnosis of toxic albuminuria was simple and the obstetrician should be prepared to make and act upon it without risking dangerous delay by depending on extraneous aids The two cardinal symptoms were albuminuria and high blood pressure of which the latter was the more important De Lee stated that a blood pressure of 130 should be looked on as a warning to greater vigilance while the limit of safety might be put at 140 This might seem unduly cautious but the blood pressure of a healthy pregnant woman tended to be low and 105/110 was not an uncommon reading

Discussing treatment Miss Basden said that there were two main objects (1) to prevent the patient from getting worse (for the hope of curing her before delivery was but slight) and (2) to do what was possible to prevent permanent damage to the kidneys The urine and blood pressure should if possible be examined daily but in hospital practice twice weekly sufficed for mild cases the more serious ones should be admitted The medical treatment was practically that of nephritis except that milk was restricted or withheld It varied in strictness according to the severity of the case the worst cases being kept in bed on water or water and glucose only The best means at present known of preventing permanent renal damage was the timely termination of a toxic pregnancy It was hardly ever justifiable to allow the toxaemia to continue for more than three weeks and toxaemia appearing at or continuing till full term should be looked upon as an indication for inducing labour at once Fortunately this seldom meant sacrificing the child The Mothers' Hospital statistics for 1931 and 1932 showed that more than 75 per cent of all cases of albuminuria did not show symptoms till the thirty fourth week or later It was therefore seldom necessary to induce labour before the thirty sixth week and a child born at thirty-six weeks had almost as good a chance of survival as one at full term and a much better one than if it had to exist for weeks in the uterus of a toxaemic mother The best and quickest method of induction was by rupture of the membranes as described by Dr Gibbon FitzGibbon and in practice its numerous theoretical disadvantages were found to be non-existent The treatment of severe recurrent toxaemia and of chronic nephritis from which it might not be distinguishable should be by Caesarean section and sterilization

Miss Basden showed a chart giving details of the seven eclampsia cases occurring in the years under review constituting 1 in 427 of all deliveries and about 3 per cent of the albuminuria cases There was one maternal death among them None of the patients had symptoms suggesting the onset of eclampsia until the day on which the fits occurred and even then subjective symptoms were only present in three cases—namely headache and loss of vision in one case and headache alone and vomiting alone in the two others In three cases the blood pressure remained below 140 and the highest blood pressure noted was 190 The prophylactic treatment of eclampsia was far more important than that of the developed condition which was medical not surgical The transition between a severe case of pre-eclamptic toxaemia and eclampsia was often so insidious that prompt Caesarean section was indicated as soon as this stage was reached Recognition of this very severe type of toxaemia depended on its response to medical treatment No single sign or symptom-complex could be relied on as a guide Most patients showed a distinct improvement after treatment in bed for twenty four hours on glucose and water only Should this improvement not occur labour should be induced at once but if the condition worsened Caesarean section should be performed Occasionally even this twenty four-hour delay proved dangerous The symptoms indicating immediate operation would be such a combination as severe headache high blood pressure much albuminuria and dimness of vision a less obvious indication would be recurrence of severe symptoms after temporary improvement Miss Basden referred to her recent report of thirty cases of pre-eclamptic toxaemia treated by Caesarean section with no maternal mortality and no subsequent development of eclampsia She had since added three cases to the series which included three cases of sterilization for severe recurrent toxaemia She would not

LONDON LOCK HOSPITAL AND HOME. (Founded 1746)

HONORARY SURGEON

The Board of Management invite applications for the above appointment. Candidates must be Fellows of Surgeons of England, full particulars and testimonials must be lodged with the undersigned on or before Monday July 3rd. The appointment will be made at a Special Court of the Governors on July 6th.

By Order of the Board
283 Harrow Rd W 9 J F MORTON
June 1st 1933 Secretary

ROYAL EAST SUSSEX HOSPITAL, HASTINGS

...d for the post of the above Institution ... a Fellow or Member of the Royal College of Surgeons of England or a Fellow or a Licentiate of the Royal College of Surgeons of Edinburgh or Ireland or a Graduate in Surgery of one of the Universities of the United Kingdom or Ireland and also be duly registered under the Medical Act.

Application accompanied by ... of three recent testimonials must reach the Secretary not later than Wednesday July 12th.

WILFRID G KEMSLEY
Secretary

The Senior Assistant Surgeon is a candidate for the post.

STOCKTON AND THORNABY HOSPITAL, STOCKTON-ON-TEES
(140 Beds—3 Resident)

suggest that without operation all these cases would have developed eclampsia but she was convinced that some would have done Patients with profound toxaemia did not stand the operation badly, and they were not therefore being asked to undergo an undue risk

SURGERY OF FACIAL PARALYSIS

At the May meeting of the Section of Surgery of the Royal Academy of Medicine in Ireland, with the president, Mr H STOKES in the chair, Mr F J MORRIN read a paper on the surgery of facial paralysis

Having reviewed the anatomy of the nerve, Mr Morrin discussed the various conditions producing interruption of its conductivity from the cortex to its distribution Paralysis appearing immediately after a mastoidectomy was probably due to section of the nerve , in such cases faradic response was lost in approximately three weeks The presence of faradism in the muscles was an indication for deferring operative treatment The methods of surgical treatment—plastic operations sympathectomy nerve suture, and nerve anastomosis—were discussed End-to-end suture he described as technically difficult, and if the nerve ends were much damaged or frayed it was impossible as tension could not be avoided He reported two cases in which facio-hypoglossal anastomosis was performed with return of voluntary movement, muscular co ordination and absence of associated movements, but without return of emotional movement Movements occurred in the first case fourteen weeks, and in the second case eighteen weeks following operation The operative procedure was described Mr Morrin considered the hypoglossal nerve more suitable than the spinal accessory as providing better co ordination, while anastomosis of the descendens noni to the cut distal fibres of the twelfth nerve prevented hemiatrophy of the tongue to a very great extent The three desiderata in the surgical treatment of facial paralysis were (1) restoration of normal facial contour and muscular tone during repose , (2) restoration of voluntary muscular control , (3) restoration of emotional expression These three functions would recover if satisfactory end-to end anastomosis could be accomplished , they might recover with a nerve graft The first two functions would recover with facio-hypoglossal anastomosis, and some emotional expression might be acquired Restoration of contour and muscular tone might be improved by sympathectomy, while some restoration of contour might be regained by plastic operations To ensure success, operation must be undertaken without undue delay

The PRESIDENT congratulated Mr Morrin on his successful operations, and on the lucid explanation of his operative technique He referred to a recent paper by Dickson Wright who stated that he did not believe in transverse anastomosis Mr W PEARSON said that the cases described by Dickson Wright were not all cases of facial paralysis , some of the operations had been done for severe facial tic, and in these the operation was much easier to perform Where a nerve graft was necessary, he thought it better not to put in a section of freshly cut nerve It was better to isolate the segment of nerve and then wait for about four weeks before putting it in When a two-stage operation was done a very good result would ensue

Mr C J MACAULEY said that anyone who had seen cases of facial paralysis and realized their distress would appreciate what a tremendous boon operation was In one case in which the facial nerve had been damaged many years previously it was impossible to find the nerve and he concluded that it had atrophied completely He performed a plastic operation which apparently was very successful but about a year later the muscle had completely disappeared This, he thought was the usual result in cases in which muscle grafts were used Dr ALAN THOMPSON referred to a case of facio-hypoglossal anastomosis, performed by Dickson Wright in which return of voluntary power was practically *nil* but emotional return was good In cases of facial spasm there was very ugly grimacing and sometimes complete loss of vision for a short time, so that the operation was very beneficial It had been suggested that facial paralysis was sometimes caused by herpes zoster of the geniculate ganglion

Reviews

A SURGEON S POCKET BOOK

Mr H S SOUTTAR has written a handbook for the use of students under the title of *A Surgeon s Pocket Book* [1] with the idea of providing them with a volume for reference ' at odd moments ' It epitomizes points of first importance in regard to the injuries and diseases with which surgical practice is concerned As in the case of the usual System, ' the book deals first with general and, later, with regional surgery As a companion in ward work and out-patient work such a summary of facts as it provides has definite uses , and it is for reference in association with clinical work we imagine that the author has designed it A few points seem to call for remark Is it correct to describe the fatty protrusions of the mid abdominal line as lipomata and are they the " starting-points " of hernia? The myeloma, or osteoclastoma, should find a place among the catalogued tumours of bone it is described elsewhere but not in this category (p 81) To place chronic mastitis typically in the fourth decade of life is to place it, surely somewhat early , in the distinction from carcinoma the bilaterality of the condition is worth emphasis The occurrence of abscess formation in connexion with diverticulitis needs mention In giving the treatment of enlarged prostate (p 267) the words " suprapubic cystotomy " are used where what seems to be intended is " suprapubic prostatectomy "

A very useful inclusion in the regional chapters is a description of the surgical anatomy relative to each region or viscus A dresser with this book in his hand will certainly find his way made easier amid the multifarious conditions with which he has to become acquainted it will adequately fulfil for him the purpose of ready and serviceable reference

MODERN ASPECTS OF GASTRO ENTEROLOGY

The special subject of diseases of the digestive organs has made great advances in the last half century Not only have the methods of investigation been enlarged by new discoveries and the application of *x*-ray technique and chemical tests, but the underlying conception of the phenomena of disease of these organs has undergone a complete change The textbooks of thirty or forty years ago dealt with the diseases according to the symptoms of the patients, as explicable by the pathology of that day Pathologists were aware of gross changes due to new growth or chronic ulceration, and of anatomical abnormalities of position causing obstruction but post mortem changes obscured the fine details of alterations in the mucous membrane lining the digestive tract Clinicians therefore, in the absence of other data, were led to regard many of the complaints of their patients as due to nervous dyspepsia and gastric or intestinal neuroses The early work with test meals, which differentiated an acid from an atonic or subacid dyspepsia only confirmed the functional aspect of the disorder Though the direct observations of surgeons at operation with their investigation of the pathology of the living took note, for example, of ulcers of the duodenum, they drew a hard-and-fast line between those patients with demonstrable duodenal ulcer and those who only suffered from hyperchlorhydria Failing however to ensure the recovery of the patient by simple short circuiting methods they practised the removal of parts of the badly functioning organ itself These parts when submitted to careful

[1] *A Surgeon s Pocket Book* By H S Souttar D M M.Ch F R C S London W Heinemann (Medical Books) Ltd 1933 (Pp 285 7s 6d net)

histological examination have revealed changes of an organic nature in the portions of viscus far removed from the ulcer itself Now the pendulum has swung across to the other side Gastro-duodenitis is the essential and underlying condition in diseases of the upper digestive tract according to the teaching of Faber and Hurst just as colitis is to be regarded as an organic complaint if we follow von Bergmann and others

A recently published book on the *Modern Aspects of Gastro enterology* emphasizes the changed point of view Dr M A ARAFA the author after serving as medical registrar to Kasr-el Aini Hospital Cairo and medical tutor at the Egyptian University was given three years leave of absence for study abroad He has divided his time between London Berlin and Vienna and has had as Dr Hurst says in a foreword an almost unique opportunity of studying modern medicine under clinicians approaching the subject by very different methods and from very different points of view Dr Arafa has set down the views of his teachers and notes of his reading in the subject of diseases of the digestive system and has combined them in a book that will be read with interest and instruction by all who work on the subject In the investigation of the stomach he declares a good history of the case proper abdominal palpation modern radiology and gastric analysis are the reliable factors for diagnosis Each of these should be given due weight and we must never depend upon the radiological report alone to give a definite diagnosis X rays can only support a provisional diagnosis based on a careful clinical examination as well as on other evidence Modern radiological technique and the chemical examination of gastric contents are described in detail Emphasis is laid on the display by special methods of the condition of the folds of mucous membrane lining the stomach thickening or irregularity of the folds may serve to draw attention to lesions which would otherwise be overlooked In this way the modern conception of the frequency of gastritis has been confirmed there may be two varieties at least—a hypertrophic gastritis where the rugae or folds of mucous membrane are abnormally thickened and tortuous or chronic atrophic gastritis where the rugae are thin and atrophic It is easy to understand that an atrophic gastritis will produce a subacidity or achlorhydria and even achylia or complete absence of gastric secretion if the atrophy has proceeded far enough Hyperchlorhydria on the other hand is not so readily explained as a sequel of gastritis except on the hypothesis that it follows when gastritis occurs in those who have constitutional hyperchlorhydria and the gastritis is thus superadded to a functional hypersecretion Setting aside these considerations however Dr Arafa finds that he can convey the modern conception of gastro-duodenal diseases under two headings—peptic ulcer and gastritis with its sequelae of which the most important is cancer of the stomach

In the investigation of intestinal diseases too radiology plays an important part when the results obtained by it are placed in proper relation to a careful history and physical examination including proctosigmoidoscopy and analysis of the faeces The colon can be demonstrated and information obtained not only about its movements but about the state of the lining membrane as well In this way the portion of the colon involved can be localized when ulceration is shown by the presence of pus and mucus in the faeces Dr Arafa deals only with ulcerations of the colon due to various causes—dysentery tuberculosis and what is called primary ulcerative colitis He omits the simple and catarrhal forms of colitis from his discussion because they clear up rapidly with complete rest and careful dieting But it is these simple and often relapsing forms which many modern authors regard as precursors of the more severe and ulcerative forms In dealing with tests of liver function the author finds none of much value except those which define the gall bladder on the *x* ray screen after the ingestion of opaque dyes containing iodine A short chapter on the diagnosis of pancreatic disease follows and then one on the dietetic treatment of the diseases of the digestive organs Excellent *x* ray photographs illustrate the various lesions described

And yet the practitioner who takes up this book will find that he may be much interested but not so much helped by these modern aspects of gastro-enterology It is right that the pathology of these diseases should be clearly defined for it is only from a basis of sound pathology that any steps towards an adequate therapy can be taken But an over simplification may lead to difficulties When gastritis is so prevalent and so protean in its manifestations the practitioner may well demand some classification with greater clinical application which will display the broad features of the complaints of his patients enabling him thus to make a good attempt to meet and treat them, and only secondarily requiring the aid of elaborate methods with *x* ray and test meals This is perhaps not possible at present but we hope it may be envisaged in more modern aspects of gastro-enterology

[1] *Modern Aspects of Gastro-enterology* By M A Arafa M R C P With foreword by A F Hurst, M D F R C P London Baillière Tindall and Cox 1933 (Pp xviii + 374 56 plates 23 figures 27s 6d)

FUCHS S OPHTHALMOLOGY

It is interesting to recall the aim that ERNST FUCHS had in 1889 when he penned the first edition of his well-known textbook of ophthalmology He abhorred note taking by his students during his professorial lectures at Vienna For these reasons he wrote I am very happy to go to the trouble of writing out the essentials of my lectures for my auditors He planned a small work but it grew under his hand for he remarked that the book the student learned to know became the familiar friend of the practising physician His work[2] has now reached the fifteenth German and the tenth English edition All the German editions except this last were the product of Fuchs s own hand and bore the sole impress of his observant and thoughtful mind In somewhat of the spirit of filial duty Dr Maximilian Salzmann professor of ophthalmology in the University of Graz Austria has now taken over the task of continuing the labours of his revered teacher The English translation has also changed hands the late Dr Alexander Duane having been succeeded by Dr E V L Brown professor of ophthalmology in the University of Chicago

The new edition has the old familiar form but there are changes of moment in its make-up The increase in size of the later editions tended to make the work too costly for undergraduate students—just those for whom it was primarily intended The present authors have taken a bold decision for the chapters on methods of examination refraction and operation have been omitted The omission leaves the book practically a treatise on eye diseases alone—the field in which Fuchs was without a peer—so that it is now called Fuchs s *Diseases of the Eye* A second and lesser change is a reversion to the custom followed by authors of many other textbooks in the inclusion of an atlas of fundus drawings There are forty-one coloured illustrations drawn by Professor Salzmann himself The choice is good and the technique of both artist and printer excellent The new revision will ensure the maintenance of this work in the premier position it

[2] *Diseases of the Eye* By H E Fuch Authorized translation by Professor E V L. Brown M D Tenth English edition. Philadelphia Montreal and London J B Lippincott Company 1933 (Pp xviii + 641 250 illustrations 41 coloured figures. 42s net.)

Well-situated corner house on main road (5 bed and dressing rooms) with garage and large garden to rent also separate Surgery to rent Scope for increase Premium £1 800

has held for so long as the most widely read of all the one-volumed textbooks of ophthalmology It is both the guide to the senior student and the reliable mentor of the practitioner, whether ophthalmic specialist or engaged in a wider and more general field of practice

IMMUNITY IN TUBERCULOSIS

Dr JEAN VAN BENEDEN has attacked one of the most complex problems of bacteriology—the nature of immunity in tuberculosis During the past few years his work has brought him into contact with many aspects of this subject and he has now embodied his results in a book with the comprehensive title of "Investigations into Infection, Hypersensitivity, and Immunity towards Virulent or Attenuated Forms of the Tuberculous Virus" [4] His observations, though rambling, are of considerable interest, and his experiments have clearly been made with an attention to detail and a regard to possible errors that are often missing from the work of others in this field One of his main contributions is towards the existence of a filterable form of the tubercle bacillus That the pathological changes occurring in guinea-pigs after inoculation with filtrates of tuberculous material are not the result of the passage of very small numbers of bacilli through the filter he has endeavoured to show by injecting normal guinea-pigs with minute doses of virulent tubercle bacilli These animals, he has found, develop the same type of lesions as do those receiving larger doses, and react quite differently from guinea-pigs inoculated with the so-called filterable form Experiments with B C G have indicated that a considerable degree of allergy develops after subcutaneous inoculation of this organism into guinea-pigs but that the resistance of the animals to subsequent inoculation with virulent bacilli is not increased On the other hand, intracardiac inoculation with B C G , though giving rise to a less durable allergic condition, appears to lead to a significant increase in resistance From this result the author draws the conclusion not only that the route of vaccination may be of much importance but that allergy and immunity are distinct phenomena The final conception that is built up of the nature of immunity in tuberculosis is vague and unsatisfying, but even this is preferable to rationalization and dogmatism

CHEMISTRY

Every new volume of MELLOR'S *Chemistry*[5] is a fresh cause of delight The book is called a comprehensive treatise but while the word comprehensive is most often used in a figurative sense only, it is quite properly applied to Dr Mellor's work and has a literal significance It appears hardly possible that any fact of chemistry can have been overlooked in its preparation and every statement is rendered easily traceable to the authority by whom it was enunciated But if the work is of compendious bulk the arrangement is no less admirable The whole of it forms a context in which nothing appears out of its proper place The copious index need but rarely be consulted to find what is wanted Even ornamentation is not lacking for in regard to existing anomalies in the nomenclature of iron and steel the quotation is introduced

Socrates Why should we dispute about names when we have realities of such importance to consider?

Glaucon Why indeed when any name will do which expresses the thought of the mind with clearness?

Volume XII has now been issued It contains the chemistry of uranium, manganese masurium rhenium and iron There is a complete and interesting account of the physiological effects and the biological functions of manganese, which begins with observations made by Gmelin and extends to matters affecting many varieties of plant and animal life Every forethought has been taken to anticipate the desire of those who may use the book It even includes a map of the geographical distribution of uranium and a summary of the iron ore reserves of Europe

BARGER'S *Organic Chemistry*[6] is written expressly for medical students, and is designed to impart the requisite teaching without penetrating the more technical branches of chemistry as avenues to medical knowledge Such a need has long been recognized, but hitherto attempts to provide it have not all been fully successful They have not escaped the fault of presuming too much on the student's previous learning Professor Barger, however, with a broad appreciation of the student's needs, has produced a constructive scheme of teaching directly connected with the elementary principles as a basis and has made his treatise easily readable, as well as complete in essential matters A pleasing feature of the book is the association of medical knowledge with chemical teaching in a way that provides the student with a connected scheme of study, recalling the manner in which chemistry was taught to medical students sixty or eighty years ago, when the chemistry, such as it was, fitted its place exactly in medical science Thus the chemistry of therapeutic substances and of the materials of metabolism and nutrition is studied in relation to their uses and functions This is a book well suited to the purpose for which it is intended, and one that may confidently be expected to engage the interest of a wider circle of readers than those for whom it was especially written

Notes on Books

The Significance of Phosphoric Esters in Metabolism by Professor R Robison, is based on a course of Herter Lectures delivered by the author in New York in 1931 It forms an authoritative monograph on an important subject in which knowledge is advancing rapidly Books of this type are invaluable, and the appearance of the work will be welcomed by biochemists throughout the world, for the phosphoric esters appear to be of fundamental importance for a considerable proportion of the activities of living cells In the first lecture the author deals with the function of these esters in yeast fermentation and in muscular contraction *Harden* showed that the formation of hexose phosphate was an intermediate stage in the conversion of sugar to alcohol by yeast The author of this monograph was chiefly responsible for advancing our knowledge of these changes to its present stage In recent years it has been shown that another phosphate ester—namely, phosphagen—is the substance whose breakdown is the immediate source of the energy which produces muscular contraction In the second and third lectures Professor Robison deals with the calcification of bone and cartilage *in vivo* and *in vitro* This subject is extremely important in connexion with bone repair and also in defective bone formation such as occurs in rickets A particularly interesting feature of the book is the portion dealing with the author's experiments on bone formation *in vitro* This is fully illustrated with plates and gives a clear account of the present state of knowledge regarding the factors that influence the deposition of calcium salts in cartilage

All communications to be addressed to Mr A V STOREY General Manager

The little work on *Heart Burial*[1] by Mr C A BRADFORD deals as he points out in a prefatory note with the ancient custom of division of the human body at death and the separate disposal of its parts as illustrated by cases associated with the London postal area In addition to much curious information which will interest the historian and antiquary the book contains chronological notes on 108 cases ranging from Henry II in the twelfth century to Thomas Hardy in the twentieth About fifty five of these are examples of heart burial and the rest either cases where there was doubt as to whether the heart or other viscera were interred or instances of undoubted visceral interment selected for their historical interest Mr Bradford remarks that though John Hunter expressed a desire that his heart should be preserved in his museum his wish was disregarded On the other hand the heart and other viscera of Livingstone the only other medical man who figures in this list were buried at Ilala in Central Africa while his body was embalmed and buried in the nave of Westminster Abbey We learn from a footnote that among French surgeons whose hearts were buried in Paris separately were Fromentin (1677) De la Peyronie (1747) and Larrey (1842)

An enlarged edition of Dr BUCKSTEIN'S book on the radiology of peptic ulcer[2] has now appeared The first edition was published in December 1929 and reviewed in this *Journal* in July 1930 In the present edition many new illustrations have been added and the literature has been brought up to date The new sections on the differential diagnosis of benign and malignant ulcer and on jejunal ulcer as well as the illustrations of the effect of treatment in the healing of peptic ulcer of stomach and duodenum are interesting and instructive In the three years that have elapsed since the first edition was published radiological technique has improved a great deal and many of the old illustrations should have been replaced by radiograms obtained with modern apparatus and films Although relief pictures are given of the folds of mucous membrane these are not shown in the same cases as the ulcer and much of the teaching value is lost It is doubtful therefore if the book will be of great use to a radiologist as it contains so much that has already appeared in textbooks and journals It may be useful to the practitioner as a summary of the radiological findings in peptic ulcer and its complications and as a reference book in the medical library

Commander W S BAINBRIDGE of the United States Navy Reserve has compiled a report of the Sixth International Congress of Military Medicine and Pharmacy and of the meetings of the Permanent Committee which were held at The Hague in June 1931[3] It is issued by the Department of State of the United States as No 12 of its Conference Series The main topics reported are those relating to the recruiting training and advanced training of military medical officers and pharmacists the psychoneuroses of war including the immediate and remote effects of war on the nervous system of combatants and non-combatants the preparation and storage of medicinal ampoules in use in the medical services and methods of haemostasis on the battlefield with special reference to the standardization of first aid material and the mode of application The contributions made by the delegates of the various countries represented at the congress are clearly set out and the unanimous conclusions reached are detailed The author points out in his introduction that much of the knowledge gained in the war can be utilized in times of peace if rendered available in permanent form The present volume is an effective illustration of this assertion

Chinium[1] the annual publication of the Kina Bureau has been written this year by Dr F JOHANNESSOHN This author in the 1930 number gave a summary of the literature on the therapeutic action of quinine during the previous fifteen years and now he summarizes the therapeutic and pharmacological works that have appeared since 1930 The importance of quinine as a drug is evidenced by the fact that he gives 465 references Malaria is dealt with in fifteen pages and references are given to recent work on plasmoquine and atebrin The quinine treatment of pneumonia is dealt with particularly fully and it is interesting to note that about ten German writers have found that quinine injections reduce the mortality of pneumonia by 50 per cent The claims regarding the results of quinine appear to be very similar to those made for the antipneumococcal serum A short account is also given of recent pharmacological work on quinine and its application for various therapeutic purposes in medicine surgery and obstetrics

Preparations and Appliances

TANNIC ACID OUTFIT FOR BURNS

Messrs C J Hewlett and Son Ltd (35 42 Charlotte Street E C 2) have sent us a small outfit for the treatment of burns by tannic acid which is both convenient and easy to use The apparatus consists of a 2-ounce bottle with spray attachment in which a tablet of tannic acid compound giving the required strength of solution can be dissolved The composition follows that suggested by Mr Mitchiner in his lecture in the *British Medical Journal* of March 18th 1933 Two different kinds of tablets are supplied ordinary and effervescent With the first a solution is attained in two ounces of warm water in a few minutes the effervescent tablets on the other hand take considerably less time to dissolve and the amount of gas given off by them is not inconvenient The whole apparatus comprising bottle vulcanite spray and rubber bellows together with a supply of tablets complete in cardboard box costs 4s 6d Extra tablets can be obtained at 3s per 100

OIL SOLUBLE BISMUTH

Stabismol is a solution of a new oil soluble bismuth compound which has been discovered and manufactured by Boots Pure Drug Co Ltd The formula of the compound is bismuth α-carboxy-cyclo-hexanyl acetate The drug is supplied in solution in olive oil and 1 c.cm of the solution contains 0 1 gram of bismuth metal The advantages claimed for this preparation are that it is less painful on injection and more rapidly absorbed than are aqueous suspensions of bismuth salts or of bismuth metal The superior rate of absorption has been demonstrated by x ray photographs Pharmacological experiments have proved the non toxicity of the compound and the purity and sterility of the preparation is controlled by analytical and bacteriological tests The dosage recommended is 2 c.cm solution (0 2 gram bismuth metal) weekly

Messrs Boots have prepared an interesting brochure which gives full details of the properties of the drug and its mode of administration and also gives an outline of suitable courses of combined arsenical and bismuth therapy for various types of syphilitic infection The introduction of bismuth by Sazeras and Levaditi has proved a valuable advance in the therapy of syphilis but there has been considerable difficulty in finding a satisfactory preparation of this metal Preparations which form aqueous suspensions are very slowly absorbed whilst those given in aqueous solution are painful and have often proved to be unduly toxic This new oil-soluble preparation ought therefore to prove a valuable advance in bismuth therapy

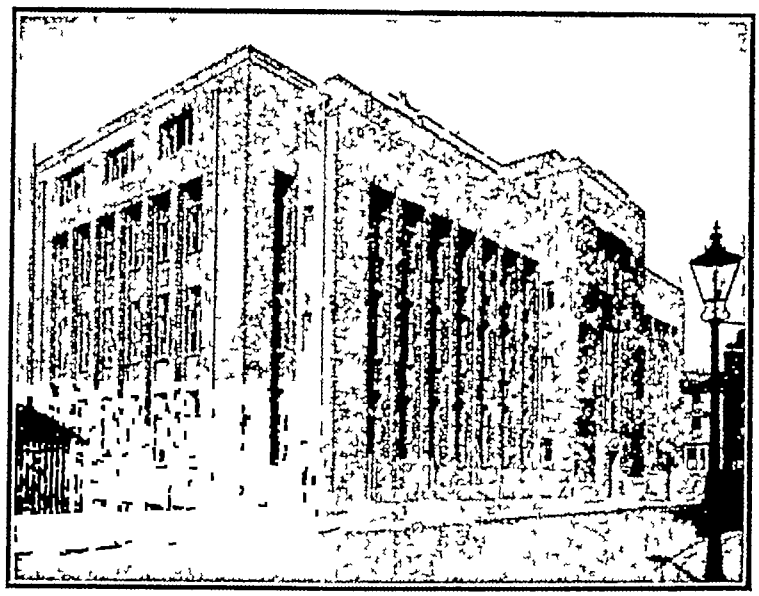
POLYVALENT INTESTINAL BACTERIOPHAGES

Enterofagos is a broth filtrate of polyvalent intestinal bacteriophages which has been prepared by the Laboratoire de Biologie Médicale of Nice and is marketed in this country by Continental Laboratories Ltd (30 Farnham Street S W 1) The mixture is recommended for oral administration in the treatment of intestinal infections of a wide variety The vendors claim that since bacteriophage by virtue of its ultra microscopic dimensions can pass through the intestinal mucosa therefore their preparation should be effective not only against gastro-intestinal infections but also against infections of the bladder and kidney

FIRTH INSTITUTE OF PATHOLOGY, UNIVERSITY OF LEEDS

It is now some seven or eight years since the University of Leeds launched its great rebuilding fund appeal, as a result of which nearly half a million of money has been collected to date The rebuilding scheme itself has made considerable progress during this time In connexion with the main university centre in Woodhouse Lane and University Road, new buildings have been erected for the departments of physics, chemistry, and mining, and the building of the Brotherton Library, for which a special donation of £100,000 was made by the late Lord Brotherton, is about to be commenced All these various sectional activities are component parts of one big architectural scheme of expansion, the architects of which are Messrs Lanchester and Lodge of London

At the Medical School also much additional accommodation has been provided A new School of Dentistry and Dental Hospital was opened some four years ago, and in 1930 a new wing was added to the existing Medical School buildings to provide additional accommodation for physiology and biochemistry Lately we have had to record the opening of the Algernon Firth Institute of Pathology[1] on a site immediately adjacent to the School of Medicine and General Infirmary For some years the department of pathology and bacteriology has been very inadequately housed, much of its accommodation being of a temporary and makeshift character The department of experimental pathology and cancer research also since its inception in 1926, has occupied temporary quarters in Great George Street In future the work of these departments will be centralized in the new institute to the great advantage of all concerned



ALGERNON FIRTH INSTITUTE OF PATHOLOGY
St George's Road Frontage

The new building has cost approximately £50 000 and is the work of Mr J C Procter and Mr F L Charlton associated architects It has been named after Sir Algernon Firth Bt whose gift of £25,000 'towards the building of an institute in which accommodation should be provided for cancer research alone rendered its erection possible The opening ceremony, on April 25th last, was presided over by the Pro Chancellor Colonel C H Tetley and was attended by a large and representative body of Leeds citizens visitors from sister universities, and others The building was declared open by Sir Algernon Firth and an address On the Value of an Institute of Pathology to the Community was delivered by Professor Robert Muir F R S

DESCRIPTION OF THE BUILDING

The new institute is a dignified austerely beautiful brick building of four stories and basement The ground floor and part of the basement provide accommodation for the bacteriological section of the department of pathology and bacteriology (Professor J W McLeod, F R S) while the first floor is occupied by the department of experimental pathology and cancer research (Professor R D Passey), and the second by the pathological section of the department of pathology and bacteriology (Professor M J Stewart) There are two practical classrooms on the ground floor with places for seventy and twenty students respectively The lecture theatre, seated for eighty four, is on the first floor The animal quarters, on the second floor, are arranged so that all the rooms open on to an outside balcony, thus preventing any odour from reaching the interior of the building The third floor is occupied by the Charles Brotherton Museum, with its various annexes The museum a magnificent room with over 4,000 square feet of floor space, is brilliantly lighted by clerestory windows, leaving practically the whole of the walls available for museum purposes

The structure except for a small amount of Portland stone in the plinth and main entrance is entirely of brick Steel stanchions are used on either side of the main central corridors to break the span, but there are no stanchions in the outer walls and the floor girders are supported on the brick walls and central stanchions In other words, it is not a steel framed building Internal partition walls are in patent light brick and are not structural in order that room sizes may be altered in the future if required, with a minimum of disturbance The suspended floors throughout are of expanded metal and concrete the floor coverings to corridors and lavatories being terrazzo, to museum and lecture room oak and in the remaining rooms and laboratories 'battleship" linoleum cemented direct to the concrete The windows are steel framed, and the fenestration is for the most part in regular bays with windows 9 feet 8 inches and piers 3 feet The museum is lighted by three tiers of clerestory windows glazed with special diffusing glass The upper tier is top hung to open out the whole range being electrically operated Stained Columbian pine flush doors are used throughout internally

All the services are exposed, the main runs being carried in ducts over the corridor ceilings on each floor These ducts are served from two vertical ducts one on each side of the staircase well—one carrying all the electrical work and the cold water supply the other hot water heating mains gas etc Each service and run is ringed with a key colour at intervals for identification All internal drainage is exposed that for the laboratories on one floor being carried in glass lined cast iron pipes on the ceiling of the floor below Heating is by low pressure hot water pump circulated from duplicate coke fired boilers in the basement The hot water supply is by gravity from duplicate coke fired boilers in the basement

The general ventilation is natural but exhaust fans have been fitted to the combustion room and fume chambers An incubator room and refrigerator room have been installed in the basement Cleaners' closets with sinks and hot and cold water are provided on each floor There is an automatic electrically operated lift

The building as a whole is spacious and well lighted, and gives the impression of eminent suitability for its purpose It is a great acquisition to the armamentarium of the Leeds School of Medicine

Under the personal directorship of Dr J FIELD HALL and J C NEEDES

who have both had many years' experience as Medical Transfer Agents

The commission chargeable in respect of any practice or partnership in Great Britain placed exclusively in the hands of this Agency has been fixed on an exceptionally favourable scale, the maximum chargeable on any transfer being fifty pounds (£50) Full Schedule of Terms and Conditions will be forwarded on application

Accountancy and legal services furnished by the Agency, where desired, at moderate inclusive charges. No charge is made to Principals for the introduction of Locum Tenens or Assistants

1 PARTNERSHIP—RIVERSIDE SUBURB (WEST)—A fourth Partner (who should be married and about 35 years of age) is required in a very old established mixed-class Practice situated in pleasant residential suburb Cash receipts for past three years average £6,879 p a A three twentieths share is offered, with option in four years to increase up to equal shares with the other Partners Appts held and panel of about 3 000 Visits 3/6 to 21/ Modern house with good accommodation (5 bedrooms, garden) Price (freehold) £2,000, or would be let at £125 p a Premium 2 years purchase

2 PARTNERSHIP KENT (within about 8 miles of the Sea, and similar distance from large town)—A fourth Partner (with some knowledge of Surgery preferred) is required in a very old-established mixed class Practice, situated in beautiful country district Cash receipts about £4 800 p a A sixth share producing £800 p a (which will be guaranteed for the first year) is offered, with option of increase at end of two years Good house with ample accommodation (5 bedrooms etc) and 3½ acres of ground Price (freehold) £2 000 or can be rented at £110 a year Premium £1,600

3 DEATH VACANCY—SOUTH DEVON—Old established PRACTICE *(held by late Incumbent 43 years) situated in very pretty agricultural* district (pop 3,500) within 2½ miles of the sea Cash receipts average £787 p a including appts worth £200 and panel of 347 Leasehold house with 4½ acres of land (66 years to run at ground rent of £13 10s) having ample accommodation Price for lease and Practice £2,700 Sport and educational facilities Locum in charge

4 WITHIN THIRTY FIVE MILES OF LONDON—Very old established country PRACTICE in pleasant residential district Gross cash receipts for the last twelve months approximately £1 800 Panel brings in over £650 p a, and appts are worth nearly £200 p a Fees from 2/6 to 15/ Midwifery 3 to 10 gns Nice house in one acre of garden and 2 acres of orchard and containing 3 reception 6 bedrooms etc, and professional rooms Electric light Main drainage Garage Price for freehold £2,500 £1 000 on mortgage Golf, tennis and other sport Premium £2 500

5 HANTS—Old-established chiefly better-class PRACTICE steadily increasing and offering very good scope for further development Gross cash receipts for last twelve months £966 and this year estimated to be at the rate of about £1 400 Panel of about 400 Advice and medicine 4/ to 10/6, visits 3/6 to 21/ with medicine extra Not much midwifery from 3 gns. Suitable house, with 2 reception 4 bedrooms, surgery dispensary, and waiting room Electric light Garden, garage Rent £75 p a Sport of all kinds and good schools Premium £1 500

6 LONDON WEST—PARTNERSHIP—A half share, producing about £750 p a (which will be guaranteed for the first year) is offered in a very old-established better class non panel and non-dispensing Practice having exceptional scope for increase Fees from 10/6 to 5 guineas Suitable Flat is available for ingoing Partner who must be experienced in better class work and preferably hold the M R C P Premium for share 2 years purchase

7 SOUTH WALES—Pleasant Coast Town (pop 40 000)—Old established PRACTICE held ten years by present Incumbent, and averaging over £1 000 p a including panel of 1 275 Visits 5/ to 10/6 Good house having charming views of English Channel, and surrounding country Contains professional rooms, 3 reception 6 bedrooms 2 bathrooms Garden with tennis court Garage Price for leasehold *(60 years to run at ground rent of £20 a year)* £1,800 Premium 1½ years purchase

8 LONDON S W—Well-established PRACTICE, worth about £350 p a, including panel of 550 and capable of increase Rent of Flat, consisting of two floors containing 2 professional rooms, dining room, kitchen two other rooms and bathroom £2 2s a week inclusive of rates and taxes Lease 5 years to run, and renewable Premium £450 or near offer

9 EASTERN COUNTIES—ASSISTANTSHIP with view to Partnership (after a preliminary period of six months at a salary of £440 p a, with free house) is offered in an old established good mixed-class Practice situated in pleasant residential and agricultural district within about 15 miles of the coast Gross cash receipts approximately £3 000 A third share is for disposal at a premium of 2 years purch

10 NORTH WALES—ASSISTANTSHIP with view to Partnership (after a preliminary period of about six months at a salary of £300 p a, all found) is offered in a better-class non panel Practice situated in attractive seaside resort A one third or three-sevenths share is for disposal (producing £800 to £900 p a) at a premium of 2 years purch Ingoing Partner should be English and pref London trained

11 PARTNERSHIP — WEST OF ENGLAND SEASIDE RESORT — *A share worth about £600 p a (with succession to the whole Practice eventually)* is offered in a very old established mixed class Practice situated in very attractive small coast town, with beautiful surrounding country Gross cash receipts approximately £1 200 p a including panel worth about £420 Visits 5/ to 30/ Midwifery from 3 gns Exceptionally nice house, with 2 reception 5 bedrooms etc, and usual offices Half an acre of garden Can be rented on lease Premium 2 years purchase

12. HOME COUNTIES—PARTNERSHIP—Residential Town within easy reach of London A share producing about £1 300 p a is offered in a very sound old established Practice producing for the last 12 months approximately £5 200 and offering excellent scope for increase Panel of 2,500 Fees from 3/6 to 21/ Very nice house with ample accommodation, or smaller one if desired Ingoing Partner should be experienced accustomed to better-class work able to undertake major surgery, and pref hold a Fellowship Premium 2 years purchase

13 RIVERSIDE SUBURB—Middle and working class PRACTICE, averaging £1 033 p a, including panel producing about £340 and appts nearly £100 p a Fees from 3/6 Detached house with nice garden and containing 4 reception, 6 bedrooms etc. for sale Premium 2 years purchase

14 OPHTHALMIC PRACTICE.—Within eighty miles of London—Practice is increasing and offers good scope for further development Average gross cash receipts for the past three years £554 Last year over £700 Fees 1 to 2 guineas Opposition slight Choice of houses Premium £700

15 LONDON EAST—Middle and working-class PRACTICE, producing £1 000 p a including panel of about 1 100 Suitable small house with sitting room 2 bedrooms, and attic waiting room, surgery and dispensary Rent £52 p a

16 DORSET—Well-established PRACTICE in very pleasant town within easy reach of the coast Gross cash receipts over £1 000 of which *about £400 is from panel* Fees 3/6 to 21/ Opposition not strong Good house, with 2 reception 5 bedrooms etc garden of nearly 3 acres Rent on lease £62 p a Premium £1 750

17 LONDON SOUTH E[illegible] working-class PRACTICE, increasing a[illegible] district Gross cash receipts for last 12 [illegible] and of 1 370 Suitable house with 2 reception and 3 bedrooms Garden Price for freehold £1 000 Premium £2 500

18 EASTERN COUNTIES — FAVOURITE SEASIDE AND HOLIDAY RESORT—Good mixed-class PRACTICE, established many years and producing for the last twelve months £1,600 Panel brings in £300 *p a and an appt* worth £100 p a Fees 3/6 to 7/6 with medicine extra Nice house, with 2 reception 5 bedrooms etc. Garage Garden Price for freehold £2 250 Golf, shooting, and other sport. Premium 1½ years purchase

19 PARTNERSHIP—In a well populated pleasant South Eastern suburb within ten miles of London the half share of an old established mixed class Practice is for disposal owing to the retirement of the junior partner Held by the remaining partner 30 years Cash receipts average £2 765 p a including panel of 1 800 and appts worth £150 Very little midwifery Pleasant semi detached corner house with ample accommodation, garden Price, leasehold (over 900 years *at ground rent of £7 p a*), £1,050 Premium 2 years purchase.

20 [illegible]erred —PARTNERSHIP—A one half share is offered in better middle class Practice in suburb of own Steadily increasing, and excellent future prospects Gross cash receipts £1 700 Panel of 700 Fees from 3/6 Very nice house with 2 reception 4 bedrooms etc One acre of garden Garage for 2 cars Rent on lease £80 p a Sport of all kinds and good schools Premium for share 2 years purchase

21 MANCHESTER—Old established middle and working-class PRACTICE producing for the last twelve months about £650 including panel *of 790 Fees from 3/6* Convenient house with 2 reception 4 to 5 bedrooms bathroom etc Rent on lease £60 Premium £950 to include furniture

22. SOUTH WALES—Beautiful country district within 4 miles of large town Small PRACTICE producing between £300 and £350 p a offering good scope Visiting fees from 5/ Very little midwifery or night work Well situated house with well kept garden containing 2 reception 3 good sized bedrooms and servants room Electric light and gas throughout Garage Rent on lease £70 p a

23 CENTRAL LONDON—Middle and better-class PRACTICE averaging for the last two years about £500 p a including small panel of 180 Fees 3/6 to 21/ Professional accommodation can be rented at £200 p a Prem £300 to include furn, drugs *instruments etc*

24 SOUTH EAST LONDON—Good middle and working-class PRACTICE, producing last twelve months nearly £950 Panel of 986 Suitable house with 2 reception 4 to 5 bedrooms etc Rent on lease £70 p a. Prem to include drugs etc and surgery fittings and furn £1 450

25 NORTH WALES—*Old-established middle and working-class PRAC*TICE averaging for the last three years over £1 700 *including* panel of about 1 300 Fees from 2/6 Visits from 3/6 with medicine extra Suitable house with good professional accommodation. Rent on lease Electric light Garage for two cars Small garden. Rent on instalment £100 p a. Premium £2 100 £1 700 down balance by instalment Good sport etc A knowledge of Welsh is *not necessary*

ASSISTANTS REQUIRED—(1) BUCKS Better-class Practice Indoor £300 p a., or outdoor by arrangement (2) BRISTOL Outdoor £350 p a all found Scottish Graduate preferred and must be single (3) SOUTH WALES Indoor £300 p a Must be young Pr f R C and able to drive car (4) NOTTS Indoor £250 to £300 Newly qualified (5) LONDON EAST—Indoor £300 p a

The Agency has made arrangements for special facilities, on very favourable terms, to be afforded to approved purchasers for the advance of part of the premium for any suitable practice or partnership Full details on application

THE SUPRARENAL CORTEX

The problem of the function of the suprarenal cortex is occupying the attention of the clinical endocrinologist the pathologist and the physiologist to so great an extent that it seems certain that discoveries of the first importance may be expected in the near future As in all investigations of endocrine function the essential action of any given gland is hidden in the complex of interactions with other glands Indeed it is not easy to define exactly what is meant by the action of a hormone If we take as an analogy the action of an enzyme the substrate upon which the hormone exerts its action is the entire organism and the final effect to be assessed is the resultant of all the responses of which the various components of the endocrine system are capable When so clear a statement as that insulin lowers blood sugar is made no simple picture of the processes leading to this end effect can readily be formed liver muscles suprarenal thyroid pituitary and centres in the pontine region of the brain all being undoubtedly concerned Bearing in mind the reservations which must attach to the term action in reference to hormones we are for most purposes content to express it in terms of the end-effects which dominate the picture Thus for the hormone of the parathyroid we have the changes in the serum calcium for the sex hormone the changes in the genital tract for insulin the blood sugar for the thyroid the metabolic rate for the pituitary the pressor oxytocic and growth effects and so on But in the case of the recently demonstrated hormone of the suprarenal cortex no clearly defined end-effect has been found Estimation of the potency of cortical extracts by the prolongation of the lives of suprarenalectomized animals with the maintenance of their weight and blood urea at normal levels is clearly very indirect and merely indicates that the tissue is essential to life The rise of blood urea after extirpation of the glands is evidence of a certain degree of renal failure and the symptomatology after the operation in animals can be correlated with the progress of this rise Thus Harrop and Weinstein [1] having shown that the normal non protein nitrogen of the blood of dogs is about 40 mg per cent found that after adrenalectomy anorexia and loss in weight begin when this value rises to 64 changes in gait occur when it is at 86 vomiting at 116 and diarrhoea at 123 That the cortical hormone is in some way closely connected with the efficiency of the muscular system is obvious from the well known clinical picture of Addison's disease whether this be due to a tuberculous process or to primary atrophy of the glands and the characteristic muscular asthenia so marked in the adrenalectomized animal Hence we are not altogether surprised that an outstanding feature of the injection of the cortical hormone into normal subjects (human and animal) should be a striking increase in the power of doing work Thus Britton and Silvette [2] have recently shown that injections of potent extracts doubled the running capacity of a normal dog and the effect was still noticeable after fifteen days Further Hartman and his co-workers [3] have found that in asthenia from other causes than Addison's disease cortical extract produced improvement with a capability of increased effort In myasthenia gravis muscular atrophy and dystrophy no benefit was obtained from the cortical extract a result which was perhaps to be expected In an interesting case described by J H Robbins [4] an acute streptococcal sore throat was followed by a complicating series of symptoms which were referred to an acute hyposuprarenalism and obvious benefit followed the administration of Hartman's cortin The evidence for hypofunction of the cortex was low blood pressure anorexia nausea vomiting loss in weight lumbar pains mental depression definite temporary mental changes and extreme weakness This author persuasively argues that if in streptococcal infections renal damage may follow the dissemination of toxic agents there is every reason to believe that suprarenal damage is also probable particularly in view of the very rich blood supply of this gland and that in post-infective asthenias the use of cortical extracts may find an extended field of application

Although we must consider that it is the deficiency of cortical hormone which is the prime cause of the syndrome of Addison's disease there are certain facts which complicate the problem Thus the treatment of such cases with cortical extracts while in most instances it prolongs life and relieves the most urgent symptoms when the process is not too far advanced fails to remove three cardinal features of the disease—namely hypotension pigmentation and hypoglycaemia Strangely enough these three characters are absent from the symptomatology of suprarenal deficiency in the dog a fact recently demonstrated by Harrop and Weinstein [1] From the point of view of the endocrinologist there is little doubt that the suprarenal cortex is intimately connected with the maintenance of what may be called sex balance and in this connexion this tissue must be considered as having some relation to the pituitary gland Neoplasms of the suprarenal cortex cause changes in metabolism changes in the distribution of the hair hypertension and marked abnormality in the secondary sex characters phenomena which are also associated with the basophil tumour of the pituitary described by Cushing In the male before puberty cortical tumours produce great growth of the body and increased development of the muscles and the external genitalia the general features of the subject tend to

The Ideal Complementary Feed

Breast feeding in many cases does not become fully established for some weeks after birth. This is no reason for weaning the baby, who should be encouraged to take the breast at the regular times.

Any deficiency in feeds can be made up with a complementary feed of Cow & Gate afterwards. The supply of breast milk comes with the demand and the correct method if breast feeding is to be established depends on never missing a breast feed and substituting a whole bottle feed, but rather to promote natural feeding by allowing the baby to take the breast at the regular hours and to make good any deficiencies with a complementary feed subsequently.

Cow & Gate Milk Food forms an ideal complementary feed as it is easily prepared, is sterile and the [illegible] milk is a close approximation to that of the mother's milk.

Cow & Gate Milk Food

EMULSION
LACTOBACILLUS ACIDOPHILUS

In addition to an emulsion of the finest liquid paraffin and agar agar, this preparation presents pure strain of B Acidophilus in an elegant form, as palatable as fresh farm milk In

CONSTIPATION

the paraffin and agar agar emulsion softens and lubricates the faeces, AND the live B ACIDOPHILUS accomplish a steady change in the intestinal flora from predominantly putrefactive to aciduric organisms Weekly examination of the stool will demonstrate this

The decrease in intestinal toxaemia is obvious from the general symptomatic response WHY NOT advise a valuable therapeutic agent in place of a mechanical palliative?

EMULSION
LACTOBACILLUS ACIDOPHILUS

is available in 12-oz bottles at 4/6 and in 80-oz. Winchesters at 25/- *(Special Prices to Hospitals)* On prescription only from your usual chemist, or direct from the

the adult type, and if the process is slow it leads to premature senility and death After puberty, however, when the virility of the subject is established, no further change in this direction is possible These facts are well known, and led to the view that overactivity of the suprarenal cortex stimulates all the mechanisms associated with virilism Two cases have, however, recently been described by H L Cecil in which the patients, young men of 26 and 27 years, showed pronounced changes in the direction of femininity as a result of hypernephromata , the matter is thus no longer so clear It is in the female subject that cortical tumours or hyperplasia lead to most striking changes in sex characters If the process begins before puberty the child tends to become obese, and develops hair on the face and pubic region , the voice coarsens and the skin becomes coarse and dry , the clitoris enlarges, the internal genitalia diminish in size, and frequently menstruation fails to start at puberty If the onset is after puberty there appears the tragic syndrome of amenorrhoea, loss of sexual interest, hirsutism, and the usual signs of virilism, with marked enlargement of the clitoris and labia and great diminution in the size of the breasts and internal genitalia In addition a sustained hypertension becomes established Heterosexuality gradually disappears In spite of this strong evidence that the suprarenal cortex exerts a stimulus to the male characters Cleghorn[6] was unable to obtain any effect on the growth and maturation of male mice by the injection of potent extracts of the cortex prepared by the method of Swingle and Pfiffner

As if still further to complicate the problem, recent work has shown that the suprarenal cortex is intimately connected with vitamin C The work of Szent-Gyorgyi has shown that the suprarenal cortex is relatively rich in hexuronic acid (ascorbic acid) and that the reducing power of vitamin C concentrates is due to, or associated with, hexuronic acid From beef suprarenal cortex he isolated 300 mg hexuronic acid per kilo and from orange juice only 100 mg , and, although these yields may be rather low, they give a good index of the relative amounts of this substance in the two sources Szent-Gyorgyi concluded that hexuronic acid is identical with vitamin C More recent work by Harris and Ray,[7] who used the ninety-day guinea-pig growth test and the tooth structure method for estimating antiscorbutic activity, strongly confirms the view of Szent-Györgyi Harris and Ray showed that the antiscorbutic power of fresh suprarenal cortex is three times that of fresh orange juice a result which is explicable on the hexuronic acid theory The antiscorbutic properties of suprarenal cortex are higher per unit weight than any other tissue hitherto investigated but the absolute amount in the liver is greater by virtue of its greater weight The peculiar fact observed by Harris that the dog and the rat are able to synthesize vitamin C when this is absent from the diet, whereas guinea-pigs, monkeys, and men are unable to do so, may lead to further knowledge of the role of the suprarenals in this connexion The present position, then, as to the function of the suprarenal cortex is one of considerable confusion, and we must await a greater array of facts before any coherent view can be developed

PLANNING BY THE PARKWAY

Those who invented the garden suburb a generation or two ago did not realize that it implied the decentralization of the city of industrialism It was one of England's brilliant improvisations, and, as so often happens, the English people who conceived the idea never thought it out fully, but left the elaboration to other countries Hence, as Mr C R Ashbee explained recently to the Town Planning Institute, we must now look for its logical development to Germany and America The Germans have reasoned the whole thing out , they have developed the law, linked the movement up with education, tackled the problems of transport and hygiene on rational lines, combined the park system with housing, the preservation of monuments, country schools, and museums, and made of the whole a logical cultural movement The Americans have specialized in the park system and the parkway, and it was with the lessons which America has to teach this country that Mr Ashbee mostly concerned himself The chief of these lessons is that the isolated suburb or garden city is no longer practicable The expansion and rebuilding of the city have to be considered in relation to its outlying suburbs and landscape areas The State park systems represent a magnificent piece of work in process of achievement by some four or five inter-State commissions, and America also has some fifty national parks and national monuments surrounded by park areas, together with many great city parks that are being incorporated into town-planning schemes The State park systems cover about ten thousand miles of parkway, which is multiplied many times by the frontage Building is permitted, subject to control, around or within the parkway, but not as a rule on the roadway We in England, in our perverse and short-sighted fashion, try to make the immediate road frontage pay the cost of the road, and so stimulate ribbon development The Americans, by keeping the buildings off the road, also keep off the local car traffic Moreover, American industrialists believe that the future of heavy industry is not in the town but in the country They believe that this development is inevitable, because they will shortly be taxed out of the towns The housing of workpeople will no longer be the affair of the master of industry, because every workman now has his own car The effect of this revolution upon great American cities in process of decentralization has been profound It narrows and simplifies town planning down to definitely reserved areas, or to centres in which all who stand for the finer cultural life may say to the industrialist "Thus far but no farther" The bearing of all this upon health can be perceived without any undue exercise of imagination

The scenery of Massachusetts was a source of wonder to the English colonists of the seventeenth century it was spoilt by industrialism and has been reclaimed by intelligent and logical planning That system is typical of the new philosophic conception which underlies planning in America to day Mr Ashbee thinks that if London had had a survey like that shown in the regional plan of New York it might have solved the problem of its bridges and avoided such blunders as the destruction of the scale of the Mall in its centre and of the many noble parks at its periphery What England has to do as the next step in the process of industrial development is he says to link up its 200 decentralizing towns somewhat on the lines of the American parkway but to a unified system with the farther sighted protective legislation indicated in the Government Parks Report of 1928 Let us never forget that care for the amenities forms part of hygiene A park system for England is necessary to protect our landscape beauty and historical associations It must provide both for national parks and for reserved or controlled private park areas within the danger orbits of the rapidly decentralizing towns Though this project can be aided by the new Town and Country Planning Act it cannot be carried out for the administration of any park system has first to be disentangled from the ordinary democratic machinery of the ballot-box and popular election More authority should be given to unbiased advisory bodies equipped with local knowledge The aim must be to consider every detail of landscape beauty and every English park as a unit for possible incorporation in a plan To produce results effective administration will be necessary Local government is still in terrible confusion and where good planning work has been done it has says Mr Ashbee been done because those engaged upon it were able to establish confidence and handle skilfully the varying and difficult elements of which statutory bodies are composed

THE BIRTHDAY HONOURS

The list of medical honours announced on the occasion of His Majesty's sixty eighth birthday will be found at page 1020 Surgeon Vice Admiral Reginald Bond who is created K C B entered the Royal Naval Medical Service thirty-five years ago and has been Medical Director-General of the Navy since 1931 Mr Thomas P Dunhill honorary surgeon to the King is associate surgeon to the professorial unit at St Bartholomew's and before the war was surgeon to St Vincent's Hospital Melbourne, the honour of K C V O which he receives will be especially welcomed by his fellow members of the Council of the British Medical Association Dr Morton Smart who is also created K C V O had a distinguished record in the R N V R during the war The honour of knighthood is to be conferred on six members of our profession Dr Raymond Crawfurd consulting physician to King's College Hospital and registrar of the Royal College of Physicians of London has long identified himself with the work of Epsom College of which he is now chairman of council Mr William Duke Elder ophthalmic surgeon to St George's Hospital was recently awarded the Nettleship gold medal and prize for the most valuable contribution to ophthalmology during the past three years by the Ophthalmological Society of the United Kingdom Dr Arthur Bagshawe has been for many years Director of the Bureau of Hygiene and Tropical Diseases Mr Hugh Duke Acland vice-president of the Royal Australasian College of Surgeons has been honorary surgeon to the Governor-General of New Zealand since 1930 and during the war served as a consultant to the New Zealand Expeditionary Force Dr Kedar Nath Das is well known to the profession in India as principal of the Carmichael Medical College Calcutta Lastly we mention with particular pleasure the knighthood for Colonel Robert McCarrison I M S director of Nutritional Research Indian Research Fund Association whose original and most valuable investigations on goitre and cretinism and on deficiency diseases have won him world-wide recognition

A SPECIAL ARTHRITIS NUMBER

The opening pages of our forthcoming number dated June 17th will contain the full text of the report of a committee appointed by the Council of the British Medical Association in November 1931 to inquire into the causes and treatment of arthritis and allied conditions This expert committee with Sir Humphry Rolleston as chairman and Dr R G Gordon as honorary secretary and vice-chairman surveyed the whole field that came within its terms of reference The Council felt and every reader will probably agree that the outcome of these deliberations ought to have the widest publicity among practising members of our profession The crippling diseases lumped together in the past almost anyhow as chronic rheumatism rheumatic gout rheumatoid arthritis etc and spoken of as this or that even to-day form a diverse group that cried aloud for critical analysis in the light of advancing knowledge The B M A Committee is modest tentative and cautious It makes no claim to have solved one of the major problems of civilized life Clarification was the aim and this we believe has been achieved In presenting the Arthritis Committee's round unvarnished tale next week as the feature of a special issue of the *British Medical Journal* instead of as a formal appendix to the Annual Report of Council in the *Supplement* we shall take the occasion to point one or two morals and to compare some of the committee's findings with parallel work in America We shall include also an account of the discussion on climatology in relation to rheumatic diseases which took place during the Whitsuntide Public Health Congress at Eastbourne and a note on the spa hospitals of this country

A SYMPOSIUM ON THE MIDWIFE

At the Maternity and Child Welfare Section of the Annual Conference of the Royal Institute of Public Health held at Eastbourne from May 30th to June 4th a discussion took place on The Role of the Midwife in a National Medical Service The uneconomic division of midwives between urban and rural areas the scanty pecuniary rewards and the absence of a pension make the lot of midwives at present an

THE MEDICAL DEFENCE UNION

President: W. S. A. GRIFFITH, C.B.E., M.D. (Camb.) F.R.C.P. (Lond.) F.R.C.S. (Eng.)

Annual Subscription, £1 — Entrance Fee, 10/

No entrance fee to those joining within 12 months of registration. — Assets exceed £70,000

In addition to the ordinary benefits of membership each Member is provided with unlimited indemnity (subject to the provisions of the Articles of Association) against damages and costs awarded in any case which is undertaken by the Union on his behalf

Full particulars and forms of application for membership can be obtained from the Secretary, 49 Bedford Square, W.C.1

unhappy one The rural midwife is the test of the efficiency of the national standard of midwifery Miss E M Wyatt, inspector of midwives of the East Sussex County Council, described the arrangements made between the Council and the County Nursing Federation, whereby district nurses, who were all qualified midwives, were assigned a district for which they did not only the general nursing, but also fourteen to twenty cases of midwifery yearly This had proved quite safe, in 1,333 cases only two maternal deaths had occurred The small cars provided for the district nurses had proved an inestimable boon Refresher courses of a month every five years were necessary, in a little village anyone is liable to become moss-grown There was general agreement among those present that the length of the period of training should be increased Dr Bethel Solomons suggested eighteen months as desirable, the period of instruction in midwifery of the general-trained nurse might remain as it is—six months Opinion differed as to the value of general training to the midwife Some thought the longer obstetrical atmosphere produced a more practical midwife, an inspector of midwives considered that nurses nurse the patients, and midwives were not taught to nurse patients, on the other hand, a midwife was taught to accept responsibility, while the whole tendency of a nurse's training is to refer everything to the doctor Slight modifications of the C M B rules were suggested Dr Solomons considered that midwives should be required to send for medical aid for breech presentations in multigravidae as well as in primigravidae, until the very end of such labours no one could say that difficulty would not arise Again, it is easy for a midwife to mistake a hand for a foot, the change proposed would prevent an unfortunate situation if such a mistake were made Any vaginal examinations made should be limited to the first stage of labour Midwives should be trained and permitted to give intramuscular injections of brandy and ether and hypodermic injections of ergot and, after the third stage but not before, of pituitary extract He thought it disastrous to allow midwives to give chloroform, even in capsules, deaths occurred after the inhalation of even a few breaths of vapour Mr L C Rivett said that these capsules had been used at Queen Charlotte's Hospital in thousands of cases without harm, patients had by their means been maintained in a state of analgesia for ten to fourteen hours Although agreeing that a timely dose of morphine might prevent a labour becoming difficult, Sir Ewen Maclean was very averse to allowing midwives to administer sedatives even doctors were very carefully restricted in the use of these dangerous drugs by the law There might be less objection to the use of anaesthetics and anodynes in midwifery if only midwives who were also registered nurses were allowed to use them but this would have the unfortunate effect of splitting midwives into two distinct classes Much efficient ante-natal work, he held, was being done by general practitioners apart from ante-natal clinics It was suggested that women who book with a midwife for their confinement should be examined ante-natally by the doctor whom the midwife would call in if there were need for medical aid The only objection to experienced general practitioners staffing municipal ante-natal clinics would be the doubt as to their being able to attend regularly Dr A H Crook considered that the proper person to undertake the management of a normal case was a well-trained midwife In Eastbourne there is year by year an increase in the percentage of cases attended by midwives alone in 1928 the figure was 66 per cent, this increased in 1932 to 78 per cent The infantile mortality rate of Eastbourne babies born in institutions was 14 as opposed to 43 among those born at home The point was raised as to whether busy general practitioners with a working class and panel practice wished to do midwifery Sir Ewen Maclean thought there would be little demur to the establishment of a panel of practitioners who were especially interested in midwifery and would be prepared to give up the time necessary for the work Although the custom of women going into institutions to have their babies was increasing, at present of 600,000 births in England and Wales every year only some 50,000 took place in institutions, and it was evident that for many years to come attention would have to be concentrated on the provision of an efficient domiciliary service Dame Louise McIlroy urged the need for providing maternity hospital accommodation for women of moderate means Sending round a questionary had brought out the astonishing lack of hospital beds for women just above the hospital class who urgently required treatment in the ante-natal stage and for abnormal labour

CHINESE QUARANTINE SERVICE

In spite of the Sino-Japanese hostilities at Shanghai the National Quarantine Service of China[1] has managed to carry out its programme with a fair measure of success The doctors at Woosung (the entrance to Shanghai) remained at their post till shot out of it by the intense bombardment They then evacuated to Shanghai During the year under review a total of 2,205 vessels were examined, and of these 733 were fumigated All the recognized fumigants were employed, the most favoured being a convenient form of hydrocyanic gas under the trade name of "zyklon B" A rat-flea survey of the port was undertaken 691 rats were trapped alive and 34,555 fleas recovered from these No plague was discovered either among live rats or those killed by fumigation Warehouses on both sides of the river were treated, by permission of their owners New stations have been taken over and all the port health services in the country have been co-ordinated every effort is being made to bring quarantine practice into line with the established procedure of foreign countries A cholera outbreak, one of the severest and most widespread in the history of China, swept over the country and visited Shanghai with full force last summer By working well together the various health bodies managed to wipe the epidemic out with a comparatively low mortality among the sick The National Quarantine Service controlled the spread of the disease among shipping arrivals and performed several thousand inoculations in the harbour of Shanghai The 1932 epidemic invaded twenty-three provinces and 312 large cities, claiming over 100,000 sick and nearly 34,000 deaths Of the big cities involved Shanghai had the largest number of sick but the smallest mortality rate—7 4 per cent Over one million, or a

FIFTEEN NEW BOOKS

NOW READY

RECENT ADVANCES IN RADIUM

By W. ROY WARD M.B., B.S., Medical Director and Surgeon to the Radium Institute and A. J. DURDEN SMITH M.B., B.S., Surgeon to the Radium Institute, London.

4 Coloured Plates and 140 Black and White Illustrations 21s.

THE SCIENCE AND PRACTICE OF SURGERY
By W. H. C. ROMANIS F.R.C.S., and PHILIP H. MITCHINER, F.R.C.S. 4th Ed. 752 Illus. 2 Vols. 28s.

STARLING'S PRINCIPLES OF HUMAN PHYSIOLOGY
New (6th) Edition. Revised by Prof. C. LOVATT EVANS, F.R.S. 562 Illustrations, 10 in Colour. 24s.

THRESH & BEALE'S EXAMINATION OF WATERS AND WATER SUPPLIES
4th Ed. Revised by J. F. BEALE, D.P.H., and E. V. SUCKLING M.B., D.P.H. 61 Illus. 42s.

ADULTERATION AND ANALYSIS OF FOODS AND DRUGS
By J. F. LIVERSEEGE, F.I.C., Ph.C. 36s.

LANG'S GERMAN-ENGLISH DICTIONARY of Terms used in Medicine and the Allied Sciences
Revised and Edited by MILTON K. MEYERS, M.D. 4th Ed. Enlarged. 45s.

DISEASES OF THE BLOOD
By A. PINEY M.D., M.R.C.P. 2nd Ed. 65 Illus., 14 in Colour. 18s.

THE MEDICAL DIRECTORY 1933
89th Annual Issue. 2,500 pp. 55,952 names. 36s.

MEDICINE—ESSENTIALS FOR PRACTITIONERS AND STUDENTS
By G. E. BEAUMONT D.M., F.R.C.P. 61 Illus. 21.

THE BIOCHEMISTRY OF MEDICINE
By A. T. CAMERON D.Sc., F.I.C., and C. R. GILMOUR, M.D., C.M. 31 Illus. 21s.

THE DIABETIC LIFE
ITS CONTROL BY DIET AND INSULIN
By R. D. LAWRENCE, M.D., F.R.C.P. New (7th) Ed. 10 Illus. 8s. 6d.

FAVOURITE PRESCRIPTIONS
By ESPINE WARD M.D. 3rd Ed. Based on the new B.P. 7s. 6d.

HALE-WHITE'S MATERIA MEDICA
21st Ed. Based on the new B.P. Revised by A. H. DOUTHWAITE, M.D., F.R.C.P. 10s. 6d.

A MANUAL OF BACTERIOLOGY
By R. TANNER HEWLETT M.D., F.R.C.P., and JAMES McINTOSH, M.D., Ch.B. 9th Ed. 43 Plates, 66 Text figures. 18s.

RECENT ADVANCES IN OBSTETRICS AND GYNAECOLOGY
By ALECK W. BOURNE, M.B., F.R.C.S., and LESLIE H. WILLIAMS M.D., F.R.C.S. 3rd Ed. 87 Illus. 12s. 6d.

London: J. & A. CHURCHILL, 40, Gloucester Place, Portman Square, W.1

NECESSARY FOR ALL SERIOUS STUDENTS. Price 15/- net. Post free, inland 15/9, abroad 16/6

3rd Edition

CONTRACEPTION

ITS THEORY HISTORY AND PRACTICE. *("BIRTH CONTROL")*

A Manual for the Medical and Legal Professions and all Social Workers

By MARIE CARMICHAEL STOPES, D.Sc., Fellow of University College, London.

CONTENTS

Introduction by the late Sir William Bayliss F.R.S.
Introductory Notes by Sir James Barr M.D. etc.
Chapter I The Problem To-day
II Theoretical Desiderata—Satisfactory Contraceptives
III Indications for Contraception
IV Contraceptives in Use Classified
V Contraceptives in Use Described and Discussed
VI Contraceptives in Use Described and Discussed (cont.)
VII Contraceptives in Use Intra and Inter-
VIII Contraceptives in Special Cases
IX Early History of Family Limitation
X Contraception in the Nineteenth Century
XI Contraception in the Twentieth Century
XII Contraception and the Law in Britain France and America
XIII Instruction in Medical Schools
XIV Birth Control Clinics
XV Municipal Clinics
Plates I to X

A few press opinions of the first edition of this world famous book

It contains much information not procurable in any other volume and may be recommended for perusal by members of the medical profession. —*Medical Journal of Australia*

Dr. Stopes sets out with precision and no little literary grace the problem of contraception. Much of the evidence contained in the book is quite unobtainable elsewhere. —*The Lancet*

Some such book as this had to be written and this is very well written. —SIR ARCHDALL REID in *Nature*

This problem will undoubtedly occupy a more prominent position in the future and to those who wish to study it we can recommend this volume. —*Journal of State Medicine*

This highly important question cannot be studied completely and dispassionately without reference to her distinctly remarkable book. —*The Hospital and Health Review*

The book is unique and marks a new era in literature germane to this subject. —*The Medical Times*

The book is supremely important and its author is one of the most important women of our time. 'So almost single-handed' she is fighting a crusade which successful or the reverse cannot fail to have a momentous effect on our civilization. —*The Scottish Nation*

third of the population of Shanghai received anti-cholera inoculation This together with a clean water supply and efficient hospitalization no doubt accounted for the low death rate which could very well lay claim to be a record one Those attacked were mostly in the prime of life The outstanding feature of this epidemic is that the efficacy of anti-cholera inoculation has been amply proved A central cholera bureau has now been established and arrangements have been made to tele graph a weekly summary to Geneva Owing to military troubles the North Manchurian Plague Prevention Service with headquarters at Harbin has virtually ceased to exist but it is promised that the work which has been carried on with such marked success for twenty years will be continued with undiminished vigour inside the Great Wall The plague papers which should have been published in the Manchurian Service reports are incorporated in the volume under review There is a good rat-flea survey of Shanghai and a survey of plague in wild rodents throughout the world is embodied in the report.

A CO OPERATIVE HEALTH CENTRE

In a report on ten years work [1] published by the East Harlem Health Center and the New York Chapter of the American Red Cross a stimulating account is given of the results achieved by the Department of Health of the City of New York and twenty-one co-operating voluntary agencies working together in a defined city area to promote the health and welfare of the residents The work was undertaken in the first place as a temporary demonstration the East Harlem district being chosen for the purpose two-thirds of the residents in this area are Italians and the remaining third consists of Jews Irish and negroes with a sprinkling of other nationalities Many of the voluntary agencies co-operating in the demonstration were already doing a certain amount of work in the district but when they had all been grouped in a single building the Health Center they were able to avoid overlapping and to see where the service as a whole was inadequate it speaks highly for the enthusiasm of the workers that these voluntary organizations which came together for a three-year trial period have worked together for ten years with a growing sympathy The executive organization adopted is set out in the report and it is noteworthy that one of the most valuable committees the House Council was developed from the informal meetings held by the various co-operating agencies in their attempts to get to know each other better The aim was not only to extend and improve existing health services but to fill in gaps two of the most noticeable of these were the lack of services for the pre-school child and the absence of dental clinics moreover the nursing service to the district was derived from several different sources and consequently incoordinate The story of the gradual conquest of difficulties and the establishment of a more general service makes encouraging reading at a moment when our own health services are driven to marking time the work of the East Harlem Center is fully justified by the results summarized at the end of the report The death rate between 1916 and 1920 the five year period before the opening of the centre was 15 34 per 1 000 at the end of 1931 it was 10 46 per 1 000 or nearly 32 per cent lower Infant mortality has also shown a marked decrease dropping from 101 per 1 000 during the period 1916–20 to 72 per 1 000 in 1926–30 Infant deaths from diarrhoea and enteritis have fallen in the same period from 22 to 5 per 1 000 On the other hand maternal mortality has not responded to improved public health measures in the same way the death rate due to childbirth instead of falling during the ten-year period under review has risen from 3 2 per 1 000 in the five years before 1920 to 5 3 per 1 000 in the five-year period 1926–30 This finding is in keeping with experience in this country and suggests that the problem of maternal mortality cannot be approached along the ordinary public health lines Effects of the economic depression on residents in the East Harlem district have been observed since 1929 when loss of employment among heads of families began to be noticeable by December 1931 the breadwinner was out of work in 45 per cent of families As a result more people have been seeking the help of the centre So far there has been no increase of mortality among infants and young children but the death rate from tuberculosis and the numbers of cases reported which had been falling have tended to become static or to increase The amount of material help given by family welfare agencies has had to be extended

[1] *A Decade of District Health Center Pioneering* Ten year report of the East Harlem Health Center Prepared under the direction of H D Widdemer Executive Officer New York City Department of Health (1 dollar)

PRIZE FOR MALARIA INVESTIGATION

A foundation was created by the Health Organization of the League of Nations in honour of the late Dr Samuel T Darling who met his death in 1925 by an accident while conducting a mission on behalf of the League The purpose of this foundation is the periodical award of a prize known as The Darling Foundation Prize to the author of an original work on the pathology aetiology and prophylaxis of malaria It is now announced from Geneva that the first award will take place on January 1st 1934 and that the Foundation Committee on the recommendation of the Malaria Commission of the Health Organization of the League has decided at its meeting in Paris on April 29th to award the prize to Lieut -Colonel S P James M D F R S of the Ministry of Health London

Sir Colin MacKenzie M D F R C S Director of the Australian Institute of Anatomy has been elected President of the Royal Society of Australia This is the youngest of the Royal Societies and has been founded with its headquarters in the national capital and branches in the various States for the purpose of advancing the interests of science in general within the Commonwealth of Australia

Cubic Space in the Hospital Ward Corrigendum —In the first sentence of the last paragraph of our leading article on this subject in last week's *Journal* (p 968) the insertion of a wrong line through a printer's error made nonsense of the meaning The sentence should read

It will be seen from what has been said above that the answer to the architect's question is not a simple one Broadly speaking etc

have made special arrangements for their admission This is well illustrated by noticing that there are forty two cases of cancer of the tongue that have been treated at the radiotherapeutic clinic during 1930 and 1931 thirty of which were growths that had started in the posterior half of the tongue, and only twelve in the anterior half It is well known that cancer of the tongue is more hopeful if it starts in the anterior half and such cases have obtained admission elsewhere in larger numbers than those in which growth had started in the posterior half"

These matters are of vast importance as enabling some conclusions to be reached upon large numbers of patients who are prevented from being received into the large voluntary hospitals, where until recently most of the available statistical material has been prepared Moreover, in many cases the disease was found to be so advanced that little or nothing could be expected from the curative point of view, nevertheless, radiotherapy has been employed in all cases when there was possibility of rendering the patient's remaining span of life as comfortable as possible under the circumstances Since the last report the equipment of the department has been augmented by the installation of one of the most recent and efficient types of high-tension generator, together with an equally modern deep therapy tube enclosed in the latest Holfelder "cannon" The new apparatus can be used for from eight to twelve hours each day It is interesting and good news to hear that expert physical advice has been requisitioned in connexion with the department This is specially mentioned in connexion with the radium work, and Mr W V Mayneord of the Cancer Hospital has been engaged in research work bearing upon the question of the amount and distribution of the radium dosage It is essential for the development of radiation therapy in this country that there should be the fullest and most complete co-operation between physician, surgeon, pathologist, physicist, and instrument maker The last of these is a highly trained electrical engineer whose specialty it is to advise upon the lay-out of installations, and who by his experience is specially qualified to give technical advice upon many practical points which might escape attention in the first instance, but which later on give unmistakable evidence of the fact that they have been overlooked We think the London County Council is to be warmly congratulated on this aspect of its hospital work

THE BIRTHDAY HONOURS

The Honours List issued on June 3rd, on the occasion of His Majesty's birthday, includes the names of the following members of the medical profession

K C B (Military Division)

REGINALD ST GEORGE SMALLRIDGE BOND, C B M B, I R C P F R C S K H P, Surgeon Vice Admiral R N

SAMUEL GEORGE STEELE HAUGHTON O B E Lieut Colonel I M S, Officer Commanding Indian Military Hospital Quetta

The 182nd annual report of the City of London Maternity Hospital covers the year 1932, and shows that there has been a reduction in the number of admissions and deliveries, associated with a longer average stay in hospital and an increase in the average total cost for mothers and children There was a considerable fall in income during the year, mainly owing to a decrease in legacies and donations A successful week end course was organized for medical practitioners, and a residential post graduate course for practising midwives proved popular and helpful In the medical portion of the report it is stated that the mortality rate was 5 91 per 1,000 for delivered cases

ALL DOCTORS' INSTRUCTIONS CAREFULLY CARRIED OUT

This print illustrates the Meyer line the key to correct hygienic shoe construction So few so called health or comfort shoes really conform in detail to the natural shape of the foot

It is our privilege to specialise in shoes that are scientifically built with the straight inside line close fitting arch and heel grip accurately balanced on heels of various heights to suit all types of disabilities

In a department run specially for surgical and remedial footwear, Charles H Baber provides shoes with in built steel supports, or to carry loose ones without slipping, with any height of heel, or no heel, straight inside lines and extra wide fronts All such shoes can be obtained at moderate 'ready made' prices in sizes to fit very narrow and abnormally wide feet from stock, or built shoes to order from instructions given to accurate measurements

Leicester Royal Infirmary

At the 160th anniversary meeting of the Leicester Royal Infirmary tribute was paid to the immense service rendered by the Hospital Saturday Society in stabilizing to some extent the income of this institution in exceptionally difficult circumstances It was announced that the returns from this fund were higher than at any period in its history and that new homes for convalescent cases would soon be erected at Overstrand near Cromer At the Swithland Home of the Hospital Saturday Society more than half the accommodation was at present reserved for cases from the Leicester Royal Infirmary and when the society's main work was removed to Overstrand the Infirmary hoped to take over the whole of the Swithland Home This would entail an expenditure of about £4 000 a year but since the Infirmary Board was already paying a considerable sum for the reservation of beds it was estimated that the additional cost of maintaining the whole of the beds could be undertaken without imprudence Close co-operation had been effected by the appointment of four members of the Infirmary Board to serve on the committee of the society The annual report of the Infirmary states that there was a slight fall in the number of in patients and a rise in the number of out patient attendances It is mentioned that the administration of the Road Traffic Act has disclosed many loopholes and the financial result of the Infirmary's claims has proved disappointing It is suggested that a small addition to the cost of insurance premiums would give to policy holders the certainty that hospitals would be reimbursed their commitments and would relieve the hospitals of a responsibility which policy holders often give intimation of their desire to accept. The income of the Infirmary for the year fell short of the expenditure by just over £1 000 which is regarded as gratifying in view of the serious financial condition in the country generally Annual subscriptions however are decreasing and the Board appeals urgently for improvement in this respect The amounts received from church collections also continue to fall The number of endowed beds and also of cots in the children's hospital is growing year by year The first stage of the enlargement of the Sir Edward Wood Nurses Home has been completed and work is proceeding on the remainder Money for this has been coming in fairly well and the Board hopes to raise the outstanding sum by June 1934 so that the enlarged home may be opened free from debt. It is felt that there is room for better co-ordination with auxiliary hospitals in the area The long waiting list has however been substantially reduced by administrative changes

Society for Relief of Widows and Orphans of Medical Men

The annual general meeting of the members of this society was held on May 24th with Mr V Warren Low in the chair The report for 1932 was presented and approved and £4 954 was distributed among the fifty two widows and eight orphans in receipt of relief Included in this was a sum of £451 which had been allotted to orphans to enable them to continue their education or to train for a professional or commercial career Three widows had died during the year one had received in grants £3 100 another £2 120 and the third £1 100 five widows and two orphans came on the funds The total membership at the end of the year was 286 which is but a very small proportion of the medical men who are eligible for membership Any medical practitioner who at the time of his election is resident within a twenty mile radius of Charing Cross can apply to become a member of the society The subscription is £2 2s per annum if under 35 years of age at the time of election £3 3s if under 45 and £4 4s if over 45 there are special terms for life membership Relief is only granted to the widows and orphans of deceased members The present scale of grants to widows left with an income of £125 per annum or less is should she be over 65 years of age £75 per annum if under 65 £60 per annum the grant to orphans is £50 per annum In addition a Christmas present of £10 is usually made to each widow and orphan The revised and redrafted by laws passed at a special general meeting on May 12th were confirmed at this meeting A subcommittee had been holding meetings during the year for the purpose of advertising the society and obtaining new members with the latter object in view it has been decided to approach each of the London teaching hospitals in turn Although the society was founded in 1788 and incorporated by Royal Charter in 1864 many medical men still seem to be unaware of its existence The invested funds amount to £140 700 and only the income of this may be applied for the purpose of making grants The capital can never be used as income Particulars and application forms for membership may be obtained from the secretary at the office of the society 11 Chandos Street Cavendish Square W 1

Graded Milk

The Minister of Health received a deputation on May 24th from the Certified and Grade A (T T) Milk Producers Association who desired to bring to his notice their objections to the scheme for the regulation of the marketing of milk submitted to the Ministry of Agriculture by the National Farmers Union The deputation expressed the fear that the proposed marketing scheme apart from its merits for the regulation of the marketing of ordinary milk would be detrimental to the production of graded milks in view of the very special circumstances which apply to this section of the milk industry The Minister of Health said that from the point of view of public health he attached great importance to the graded milk movement He understood that the Minister of Agriculture would shortly hold an inquiry into the proposed marketing scheme and he had no doubt that the association would be given a full opportunity to state at the inquiry the difficulties which they felt in the application of the scheme to graded milks and that their views would be fully considered

Prevention of Cruelty to Children in Liverpool

The Liverpool Society for the Prevention of Cruelty to Children was founded on April 19th 1883 and the fiftieth annual report contains a survey of the work achieved during the last half-century At the inaugural meeting it was pointed out that the value of the efforts made by the Society for the Prevention of Cruelty to Animals had been so noteworthy that a campaign on similar lines on behalf of children might well produce at least as good results Following the issue of the society's first annual report kindred societies were formed in 1884 in London Manchester Edinburgh and Glasgow the Liverpool rules and objectives being adopted by each in turn In 1889 the Act for the prevention of cruelty to and better protection of children placed on a firm basis the ideals which the various societies had promulgated and gave power to punish offenders Some later overlapping with the work of the National Society was removed by an agreement reached in 1897 under which the city of Liverpool and the borough of Bootle remained entirely under the Liverpool Society outlying parts being served by the National Society which had evolved from

FEW PARENTS

have either the time or opportunity to perform the most necessary task of choosing really suitable books for their children from the vast mass available Too much is left—dangerously—to chance

CHILDREN

The receptive child mind is especially susceptible to the influence of books Books which help to form character are surely of the utmost importance Admitting the same truth of this you will welcome the expert help of the Junior Book Club which offers its services free of charge

A FREE SERVICE

Each month the expert Selection Committee choose and recommend several books one of which is sent to each member anywhere in the world a certain insurance against the purchase of trashy books The Committee's services and advice cost nothing

THERE IS NO ENTRANCE FEE

No charge is made by the Club beyond the actual net price of the books selected namely 5s each per month You can exchange books too Thus all that you pay under this unique scheme is three pounds for full annual membership You pay this either in one sum of three pounds or three sums of one pound at intervals of three months whichever you prefer Alternatively you may become a monthly member at no extra cost The names of the Committee are your guarantee of wholesome worth while books for your children Here at last is a sensible gift which provides both a thrilling monthly surprise for the children and the sense of a duty well done from your point of view You can use the coupon below either to enrol a member or to obtain further information

DISEASES OF THE HEART

THEIR DIAGNOSIS PROGNOSIS, AND TREATMENT BY MODERN METHODS

With chapters on the Ink Polygraph Clinical Electro-Cardiography and Anaesthesia in Relation to Cardio-Vascular Affections

By FREDERICK W PRICE, M D, F R S (Edin),

Senior Physician to the National Hospital for Diseases of the Heart Consulting Physician to the Royal North ern Hospital London

Demy 8vo Pp 534 With 249 text figures including 32 sphygmograms 92 polygraphic tracings and 8 electro-cardiogram

NEW SECOND EDITION, 21s net

By great care and by the use of an amazing amount of material he has accomplished what many readers have been waiting for giving us a complete account of the diagnosis, prognosis and treatment of h art diseases by modern methods in association with all the invaluable teaching brought to us by the older masters of clinical observations —LANCET

The most valuable and comprehensive guide to the study of Cardiology with which we are acquainted. —NEW YORK MEDICAL JOURNAL AND RECORD

We think that most of our readers engaged in general practice will find this work extremely useful. —THE JOURNAL OF CLINICAL RESEARCH

In our opinion the book is indisputably the most authoritative contribution to cardiology of our time —FRANCO-BRITISH MEDICAL REVIEW

"A book which we believe is destined to remain the standard work on Cardiology for many years to come. —AMERICAN MEDICINE.

"The second edition of this popular work on heart disease bears evidence of thorough revision while the essentially clinical standpoint of the writer is maintained."—EDINBURGH MEDICAL JOURNAL.

"It may be said at once that the book adequately fulfils the purpose it has in view and is a perfectly sound lucid and reliable guide" —NEWCASTLE MEDICAL JOURNAL.

"Well-written, concise and complete containing a wealth of practical information. Obviously based upon the author's own experience and investigative work." — SURGERY GYNECOLOGY AND OBSTETRICS (Official Journal of the American College of Surgeons).

"Dr Price is to be congratulated again on the reappearance in its second edition of his distinguished contribution to the important subject of Cardiology "—THE CANADIAN JOURNAL OF MEDICINE AND SURGERY

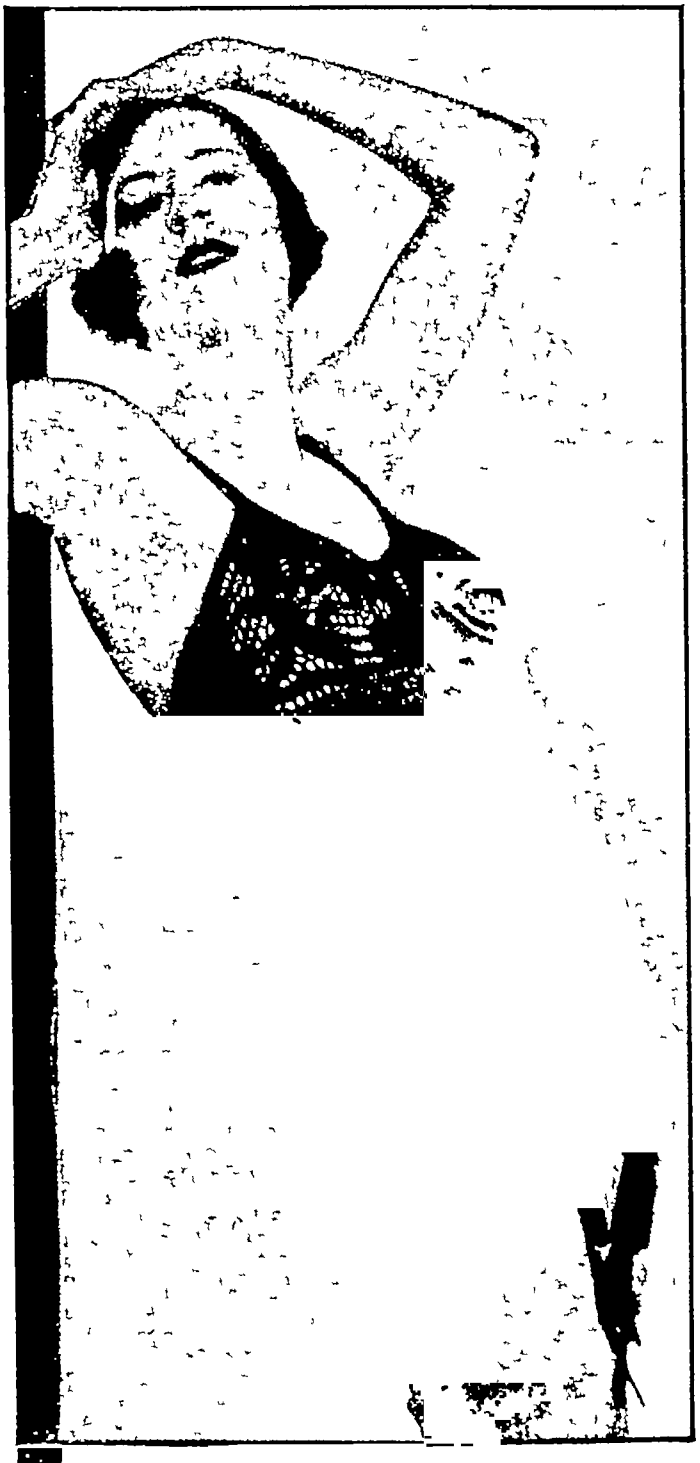
Belts by Roussel, though artistic, are designed with anatomical accuracy for post-operation and maternity wear



Realising the vital importance of anatomical accuracy in the designing of belts for post operation and maternity wear, M Roussel, after more than twenty-five years of study and experiments with many designs suggested by anatomical experts, evolved the principles he now uses

Many prominent medical men now habitually prescribe a belt designed by M Roussel for such of their patients as require abdominal support or control

All belts designed by M Roussel are woven in strong, light, porous, elastic tricot, and are especially made to give adequate support **without** unnatural compression

Since M Roussel undertakes a six months' guarantee of wear and adjustment service to ensure perfect fitting, belts designed by Roussel are only obtainable at the Roussel Salons listed below

PRICES { HIP-BELTS from 30/-

the London Society Successive Acts of Parliament enabled the work to be extended and intensified, and the advances made are recorded by means of abstracts from the various annual reports up to the present During 1932 the number of children under observation was 3,444, in addition to 3,127 under supervision on January 1st of that year It is stated that most of these were cases of minor neglect The total number of children helped and protected during the half century was 297,857 A statistical table for the fifty years shows that the number of children requiring help was at its maximum during 1904 to 1914 Prosecutions of parents and guardians were highest between 1892 and 1903 when the figures ran to three or four hundred each year This contrasts sharply with four such prosecutions in 1932, one in 1931, and five in 1930

Scotland

Chair of Surgery at St. Andrews

At a meeting of the Court of the University of St Andrews on June 2nd Mr John Anderson was appointed professor of surgery in succession to the late Professor L Turton Price Professor Anderson was born in Banffshire in 1886, and after studying medicine at Aberdeen University, graduated M B , Ch B there in 1908 He then acted as house surgeon at the Royal Infirmary of Dundee, and for two years thereafter studied in Tübingen and Berlin Returning to Dundee, he was appointed a member of the surgical staff of the Royal Infirmary, and during the war became surgical specialist to the 20th Casualty Clearing Station in France with the rank of major R A M C Later he acted as a consulting surgeon in the Third Army, and for his military services was awarded the D S O On his return to Dundee he became surgeon to the Royal Infirmary and was consulting surgeon for orthopaedic cases to the Ministry of Pensions in the Dundee area He has devoted special attention to the use of high-frequency electricity in general surgery, and his numerous contributions to current surgical literature include the following

Surgical Treatment of Severe Penetrating Wounds of the Chest in a Casualty Clearing Station," *British Medical Journal* 1917 , ' Surgical Diathermy in Breast Cancer, ' *British Journal of Surgery*, 1928 , and ' Tuberculous Hyperplasia of the Large Intestine," *Edinburgh Medical Journal* 1931

Health Services Inquiry in Scotland

Sir Godfrey Collins, Secretary of State for Scotland, in addressing a recent meeting at Greenock, announced that a review of the health services in Scotland would be undertaken shortly by a special committee After referring to the Housing Acts of 1926 and 1930, under which nearly 21 600 houses had been completed and over 8,000 were under construction he said that the time had come when it was necessary to take stock of the other health services in Scotland with a view to ascertaining whether expenditure on them was being applied in the wisest and most effective manner He proposed therefore, to appoint a committee to review the existing health services of Scotland in the light of modern conditions and knowledge, and to make recommendations on any changes in policy and organization that might be considered necessary for the promotion of efficiency and economy What was contemplated was a comprehensive inquiry which would survey the whole health organization including sanitation, maternity and child welfare school health services, tuberculosis service the insurance medical service hospitals, and all other agencies concerned with the health of the community These services had grown up in a haphazard way for the past fifty years, and to day they represented a varied series of activities which required pulling together Much had been achieved in reducing death rates, but the results were less than might be expected from so much effort and expenditure

Close of an Old Edinburgh Charity

With the death of Dr Charles H Thatcher the Edinburgh Lying in Institution, in which his family has taken a close interest for 117 years, comes to an end In 1816 a dispensary, which afforded gratuitous advice and medicine in the diseases of women, infants, and children and also attendance during confinement, was established by Dr John Thatcher From 1816 to 1824, 12,000 patients received medical relief at this dispensary from Dr Thatcher and his apprentices, while over 1,000 were attended during confinement The dispensary was then situated at 13, High School Yards, and in 1824 a public appeal was issued and the dispensary came under the management of a committee After the death of Dr John Thatcher in 1853 the work was carried on by his son Dr Lewis Thatcher, who died in 1876 Dr Charles H Thatcher, grandson of the founder, then took over the work, and continued the institution for the training of midwives and nurses, who attended the patients under his supervision He took an active interest in the institution until the time of his death

Ireland

State Control in Public Health

At a recent meeting of the Northern Ireland Branch of the British Medical Association, Dr C S Thomson medical superintendent officer of health, Belfast delivered an address on " The Outlook in Public Health " D aling with modern State services, Dr Thomson pointed out that between 1874 and 1930 Parliament imposed duties of a preventive kind upon every registered medical practitioner With the appointment of so many medical men to State services, such as the school medical and maternity and child welfare services, the general practitioner began to wonder whether this was for him the end of all things The passing of the National Insurance Act had brought in 15,000 doctors as the medical advisers of 15,000,000 people, and it had brought prosperity to the medical profession Would the State system of medical practice engulf the general practitioner? It could never come without his own consent Something might have to be done if the volume of taxation led people to forget their duty to their noble voluntary hospitals Again pensions would have to be found for the older medical practitioners who had faithfully served their fellow men, but the expenditure of public money on pensions involved public control

Co-ordinated Medical Services in the Dublin Hospitals

At the conclusion of the draw for the sweepstakes in Dublin Dr R J Rowlette, vice chairman of the Hospitals Committee, in thanking subscribers for their generous support of the Irish hospitals, said he was particularly grateful for the world wide confidence in the integrity and efficiency of the sweepstakes He also thanked the Hospitals Trust and their staff for the extraordinary efficiency with which they had carried out the sweepstakes, and those others who had contributed to its success, including the nurses and the Commissioner of the Garda Siochana As a result of these sweepstakes it was hoped, within the next few years, to have an efficient hospital system under which there would be a co-ordinated service, and not as in the past, a number of hospitals each trying to cover the whole ground of medical

service That did not give the best results no matter how efficient each individual hospital might be The sweepstakes would also benefit another important aspect of hospital work—namely medical research If they had funds to spare for this worthy object much progress might be made in the alleviation of human suffering

Stamp Duty on Hospital Sweepstakes

SIR JAMES CRAIG (Dublin University) in the course of the debates in the Dail on the committee stage of the Public Hospitals Bill protested against the stamp duty in its application to the moneys derived from the sweepstakes A year ago when the tax was first introduced and the sweepstakes on the Derby was at the peak he warned the Minister of Finance They saw what had happened the sweepstakes on the Derby had fallen by one million pounds and not only was the total sum received less by over £900 000 but the amount going to the hospitals was down by £221 000 He wondered if the Minister even at this late date would not reconsider the matter During the last twelve months the Exchequer had received no less a sum than £1 011 393 from the hospital fund in view of that he supposed he could not expect the Minister to change his mind but he did ask him to consider whether his action would not in the end wreck the whole scheme He had received letters from a great many people who had refused to have anything more to do with the sweepstakes because the Government was collecting as revenue money which was subscribed for the deserving hospitals Sir James subsequently moved two amendments to the Bill The first aimed at deleting the section which provided for the setting up of a single fund and the second at securing that the National Hospitals Trustees should divide the moneys received in respect of a particular sweepstakes into two funds in the proportion of two-thirds and one third the first fund to be known as the Promoting Hospitals Fund and the second as the General Fund In the Bill the Government had gone back on the provision of the original Act and proposed to form the surplus into a single fund This was viewed with suspicion The Minister could do what he liked with the fund and not a single penny unless he chose would go to the voluntary hospitals In reply the Parliamentary Secretary Dr Ward said that the one intention in the minds of the promoters of the Bill was to secure that the best results in the matter of hospital accommodation and equipment should be made available for the poor as the result of the financial opportunity that the sweepstakes offered

CORRESPONDENCE

"New Treatments for Old"

SIR,—Having read and reread with interest and profit Lord Horder's oration I still feel like one of your correspondents last week that it needs some reply or at least some amendment of emphasis It would I think be disastrous for our profession were it allowed to stand as the final word on our attitude to those outside the two old-established firms who are adding to our stock of therapeutic agents if not of knowledge While holding no brief for any of these firms I can only say that on the various occasions I have written to them I have always received the utmost courtesy and consideration they have given the information I asked supplied references to literature or translations from foreign literature and at times they have carried out special clinical investigations on behalf of my patients which neither they nor I could pay for entirely without charge or even any acknowledgement from me until now To throw scorn on such services seems neither helpful nor generous

I think that what is actually happening is that a slow and hitherto silent revolution is taking place in our work Many of the products put on the market are admittedly somewhat experimental For all that the manufacturer—as I have met him—is not merely out to sell his *new* drugs He is even more concerned at first to find out about their clinical action Lord Horder has made it clear that he will not help in this quest and many eminent physicians take the same attitude As a result the maker turns to the general practitioner and gives him the opportunity of doing so instead If he communicates his results direct to the maker the latter is usually most grateful More commonly he does not and the manufacturer then has to form his own opinion by whether the demand for the product increases or not The system is admittedly imperfect or even wasteful but it has one crowning virtue for the profession in that it gives every G P the opportunity—should he wish it—of doing some original clinical investigation If done carefully and critically it sharpens his wits increases his knowledge may add some treatment of value to therapeutics and not infrequently enables him to cure a patient pronounced incurable by a consultant relying on the older methods to which Lord Horder would have us revert

By this I do not mean to imply that every patient should have some new treatment Far from it I still use treatments handed down from my father grandfather and great grandfather among which the use of small doses of digitalis to which Lord Horder refers holds an important place But where patients do not improve as fast as we or they should like it behoves us to see if we cannot do something better A return to principles surely does not mean a return to the primitive meaning of clinical and therapeutics Clinical medicine in this twentieth century surely means more than merely putting a patient to bed and therapeutics more than merely tending him there While granting that the first thing in medicine is diagnosis we must never forget that patients come to us not to be labelled but to be cured In this connexion may I commend to Lord Horder a companion to his Good Samaritan story and one I think much more typical of general practice?

A few weeks ago neither I nor my partner was satisfied with the progress of a lady patient and a consultant (for whom I and the whole profession have the highest regard) kindly came to see her She had been having some of the massive doses to which such exception is taken and as a result the clinical picture was obscured I thought it was probably a case of septicaemia in spite of the mild fever present The advice given was to withhold the obscuring treatment let the temperature soar if it would and then take a blood culture and so the diagnosis would be clenched! Being only a general practitioner I preferred to carry on as I was for I feared that if the weakened patient had been allowed to develop frank signs of septicaemia I might never get it under control again I am glad to say the patient is doing well Unfortunately in general practice we sometimes have to choose between getting a patient well and making a diagnosis This may be rank heresy but it is none the less true

Lord Horder is particularly horrified that a drug should be considered a specific for ailments with so different a pathology as influenza and furunculosis That however does not prevent practitioners from securing striking results in these conditions from such to all's different agents as S U P 36 antibacsyn edwenil or omnadin to mention a few of which I have slight experience and to which some of his remarks seem particularly directed. They do not always work the oracle but they sometimes do and some I think more often than others Our practice is founded above all on observation and surely instead of bewailing these results we should greet them with the hope that even in such varied conditions there

IN GENITO-URINARY INFECTIONS

To combat chronic or acute genito-urinary infections—cystitis, pyelitis, cervicitis, prostatitis, vaginitis, gonorrhoea, etc.—Pyridium has been proved of marked value. It is early and gradually eliminated through the urinary tract, on which it exerts its antibacterial effect not only on the surface but also, owing to its power of penetration, on the submucous area. Pyridium, in a concentration which is possible for and harmless to the body, has an antibacterial action in the urine against invading organisms particularly gonococci, staphylococci, streptococci and the B. Coli com

It acts effectively in either acid or alkaline urine. Pyridium, which is conveniently administered orally in tablets (0.1 gm.) usually 2 tablets t.i.d., fulfils all the desiderata of an ideal urinary antiseptic.

Sphagnol for Haemorrhoids

"I am constantly prescribing it"

Haemorrhoids are very painful, so that any healing ointment used should also be soothing and cooling. Sphagnol Peat Ointment is most suitable, and many doctors have found it excellent as a palliative. The letter quoted above, for instance, reads in part: "I have found Sphagnol Ointment of the greatest value again and again in cases of haemorrhoids, including haemorrhoids in pregnancy. Nothing in my experience has proved so effective, apart from surgical interference, and I am constantly prescribing it."

—M.B., M.R.C.S.

The peat distillate principle contained in Sphagnol Ointment is present to a lesser degree in Sphagnol Shaving Soap. There is probably no other shaving soap that leaves the skin so cool and fresh. Use it yourself. Write to us at the address below and we will send you free samples of our preparations.

Peat Products (Sphagnol) Ltd., Dept. B 104, 21 Bush Lane, London, E.C.4

may be a treatment suitable for all It is really no safer to argue that because the disease processes, as known so far, are different, therefore no one drug can benefit them all than to argue that because all the locks in a house seem different there cannot be a master key

The fact is that modern medicine has passed through many stages First of all, diseases were described and classified, then came the search for causes, lately we have had a wonderful time while biochemistry, etc, has shown how these causes work Preventive medicine has thereby gained a good start, but many of us hope that we may even now be entering on the time for which all this labour is but a preparation—the time, that is, when we may reverse these workings of disease and actively aid, expedite, or imitate the workings of nature, and so really 'cure' disease as well as treat it To this end clinical experiment is actually more important than laboratory tests (immensely valuable though these are), and under present circumstances a vast amount of clinical work is being done The trouble is that the practitioners who are doing it have little time or energy left to classify and communicate their results, otherwise progress would be much faster (Incidentally this letter would never have been written had I not been laid up with influenza)

Let not Lord Horder throw cold water on what we general practitioners are trying to do in our humble way and impeded circumstances Can he not use his great powers and influence to help us to get the best out of the new circumstances and give us an oration to cheer us up in the fight instead of sounding the retreat to the old positions? I am sure that none could do it better, unless it be Sir Humphry Rolleston, the memory of whose profound appreciation of the old with his no less profound appreciation of the new has been for nearly twenty years alike the despair and the inspiration of his clinical clerk,

Your obedient servant,

Winsford Cheshire, May 31st W N LEAK

P S —Lest any should read into parts of this letter anything so stupid as an attack on consultants I would like to say categorically that no such is intended Most of us would be in a poor way without them, and I am especially grateful for the pains taken over my poorer patients when they attend the Manchester Royal Infirmary and for the full reports I often receive about their condition W N L

SIR —With the exception of a few diseases due to gross parasites there is no cure for any disease by medical means No one can say 'This is a case of mumps or meningitis and I can cure it" Physiology and biochemistry are in their infancy, and very little is known of the complicated chemical changes which take place in the tissues in health and disease The constitution of the molecules of proteins, hormones, vitamins, etc is still obscure and without this knowledge there is little hope of a cure for disease or 'morbid process" Palliative treatment is plentiful, dangers can sometimes be avoided and there are some slight indications of the direction in which curative agents are to be sought and possibly found —I am etc

Windsor May 4th W F LLOYD

"Nerve Energy"

SIR —I must see that Professor W Burridge has thrown much if any light on the problem of the reality of nerve energy (*Journal* May 27th, p 936) One physiologist at least does not base his views regarding nerve energy upon the nerve muscle preparation, for quite one of the best accounts of nerve energy is by Professor Howell of Baltimore, in his *Textbook of Physiology* from which I quote (ninth edition, Saunders, 1924 p 134)

"Modern physiologists have considered the cell body of the neuron, including the dendrites as the source of the energy displayed by the nervous system and it has been assumed that this energy arises from chemical changes in the nerve cell as the energy liberated by the muscle arises from or is dependent upon, the chemical changes in its substance It would follow from this standpoint that evidences of chemical activity should be obtained from the cells and that these elements should exhibit the phenomenon of fatigue'

Professor Howell goes on to speak of fatigue of nerve centres (chromatolysis), and correlates this with the familiar sensations of tiredness Here, therefore, we have a physiologist discussing the doctrine, if we may so call it, of nerve energy upon general physiological lines My complaint in the past has been that hardly any other physiologist has seriously dealt with the concept of nerve energy and, consequently not indexed the words whereas, as I have repeatedly pointed out, the clinicians and psychiatrists use the concept freely, and as though it had never been looked at askance

It is, to say the least, very unsatisfactory from the student's point of view, to find his clinical teachers employing as valid a concept which his teachers in physiology either ridicule or ignore One set of writers seem persuaded of the existence of something which the others will not even discuss Ought we not to try to put an end to this state of intellectual indecency, and come to some sort of understanding with the clinicians regarding a concept which some of us believe to be a fundamental one among those which relate to the functions of the central nervous system?—I am, etc

London W 4 May 31st. D FRASER HARRIS

Genesis of Gall-stones

SIR —A not unimportant amendment might be made to the statement in Mr D H Patey's review on the mechanism of gall-stone formation in the *Journal* of May 20th (p 866), that "cholesterol gall stones of the type found in man have never been found naturally' in animals Edington (*Veterinary Record* 1927, vii, 353) found two gall stones, one in the gall bladder and the other in the left bile duct, of a three and a half year old cock canary which was suffering from biliary cirrhosis, the stones gave positive Salkowski and Liebermann reactions for cholesterol In the distended but otherwise normal gall bladder of a two-year old cock canary which died of acute pasteurellosis I found two greyish coloured, semi-translucent, oval-shaped gall stones (each about 0 2 cm long), which readily disintegrated on pressure in a cover-slip preparation into what appeared microscopically to be pure cholesterol crystals Burgom (*Journ de méd vét et de zootech de Lyon* 1882, xxxii 343) described a 320 gram stone which he found in the bile duct of a seven-year old horse as composed almost entirely of cholesterol However, Burgom's statement which was unsupported by competent testimony, is not confirmed by the records in veterinary literature of gall stones in mammals

Stones have been found in the gall bladder or bile ducts of cattle, horse (which does not possess a gall bladder) dog, swine, and rarely of cat and sheep I have found two hard stones (not analysed) in the distended and chronic inflamed gall-bladder of a drake, and Fox (*Diseases in Captive Wild Animals and Birds* 1923) reported six cases of 'gall stones'—in the beaver (2) brant goose, pig-tailed macaque, polar bear, and mongoose lemur The incidence of gall stones is highest in cattle—for example in approximately 0 5 to 1 per cent of cattle slaughtered in the United States of America (vide Feldman *Journ*

Cancer Research 1928 xii 188 Gauss and Davis *Journ Amer Vet Med Assoc* 1932 lxxxi 71) On analysing all the reports in the available veterinary literature of the past fifty years I find there is no significant difference in sex incidence and no constant pathological change associated with the stones No macroscopic abnormality of the biliary system or liver is found in the majority of bovine cases whereas biliary cirrhosis is reported in the majority of equine cases The stones usually found in mammals consist principally of bile pigment and bile salts traces of cholesterol may also be found Concretions composed principally of the carbonate and phosphate of calcium and magnesium mixed with bile and formed around a foreign body—for example a crystal of quartz a grain of corn or a dead parasite—are not uncommon in the horse

I suggest that progress in experiments on the genesis of cholesterol gall stones might result from the investigation of canaries—I am etc

Hernia and Appendicectomy

SIR—The correspondence on this subject in your columns has perhaps necessarily brought about a comparison between two incisions—the muscle splitting and the muscle retracting

I have certainly never connected the possibility of the gridiron incision which I practically never use now for appendicectomy with the production later of an inguinal hernia It seems to me very probable however that this may happen even if only on theoretical grounds It is not difficult to imagine where the muscle supports of the inguinal canal are weakened or paralysed and there is loss of shutter action that it might be easier for abdominal contents to slip into a lurking indirect hernial sac I saw recently an appalling ventral hernia occasioned by the use of a muscle splitting incision plus sepsis The last dorsal nerve at least had also been involved and the whole of the right lower abdominal quadrant bulged hideously being surmounted by the actual thinned-out scar and hernial sac During the last year I have seen two other ventral hernias from this incision Furthermore repair of a muscle splitting incisional hernia is surely attended with less chance of cure than a hernia following rectus sheath incisions Why split muscles when there are means of causing less injury by retraction as in Battle's incision? All I think will admit that exposure is not so good with a McBurney incision—surely an important point in almost all appendix cases since we never know beforehand how difficult an appendicectomy may be We may also want to hunt for a concretion I believe that abscesses are better opened by sight so that every drop of escaping pus can be mopped up

Mr Geary Grant's letter (May 20th p 892) gives cause for comment He favours the muscle splitting incision and states I believe it is a better situation for drainage the ilio-inguinal and ilio-hypogastric nerves are unlikely to be injured except from sepsis What of the last dorsal nerve too? He also says I am ready to admit that where drainage has been carried out through this incision it may be a cause of post operative pain And how painful these lateral abdominal incisions can be! Why then employ an incision which may meddle with nerve tracts? In his last paragraph he mentions reasons for giving up Battle's incision which are not easy to agree with It is surely not difficult to avoid dividing one or more of the nerves to the rectus The nerves pierce the posterior sheath of the rectus so that mobilization of the outer edge of muscle is free from danger The nerves now lie in some transparent membranous tissue behind If a bold transverse gap is made through this soft yielding membrane and areolar tissue and the edges are retracted up and down with the finger all nerves and vessels are carried out of harm's way at once It remains to incise the absolutely bare posterior sheath If local difficulties above or in the pelvis demand a little more exposure it is still a simple matter to enlarge the opening in the posterior sheath up or down behind the nerve bearing retracted tissue If the upper abdomen has to be approached I sometimes convert Battle's incision into a right paramesial with retraction of the rectus outwards Adequate drainage of the rectus sheath and a tube (if drainage be employed through the original incision) left in for the shortest possible time and not the longest ensures against ventral hernia The outer edge of the thick muscle is a very adequate barrier for any tendency to hernia under these conditions—I am etc

So called Pancreatitis in Mumps

SIR—In case the symptoms of the complication of pancreatitis in mumps are not generally known I am sending you notes of a case I have recently seen as there is a definite danger of unnecessary operative intervention

The patient was a youth aged 20 who developed right sided parotitis The symptoms were very mild and at the end of the fourth day had practically disappeared On the seventh day his temperature ran up to 104° F He was acutely ill His abdomen was much distended with general pain and tenderness all over it but there was no localized pain or rigidity He had nausea but was not sick Restlessness headache and photophobia were prominent symptoms The patient's relatives were apprehensive of appendicitis and both a surgeon and a physician were called in the former taking a serious view of the case and ascribing the symptoms to a partial intestinal obstruction The latter was more cheery about it but both were of the opinion that the case was not mumps and that the parotitis had its origin in some abdominal disease With the exception of a slight leucopenia the blood picture was normal The reactions to the enteric group were negative and the blood was sterile In forty-eight hours the boy was well

In discussing the case with a colleague he informed me that a similar train of symptoms occurred to him in America His condition was so alarming that it was decided to do a laparotomy This fortunately was averted on the advice of a man who recognized the symptoms In his case too the pancreatitis was well in a couple of days but on the fourteenth day of the disease he developed orchitis

The medical officer of a large public school tells me that this complication is not uncommon and he knows of a similar case which was operated on for appendicitis and a normal appendix removed

It would be interesting to know on what grounds the pancreas is considered to be involved In this case there was no tenderness in the epigastrium no sickness no characteristic stools The urinary diastase was unfortunately not estimated till rather late but was then normal—I am etc

OVALTINE

FOR THE GROWING CHILD

Ovaltine is indicated as a means of promoting normal growth and development when the weight of the child under observation is less than that which statistics show a child of the same height should weigh

The physician has only to consider the composition and properties of the product to recognize how suitable it is as a building and reconstructive nutrient.

"Ovaltine" is a concentrated extraction of malt, milk, and eggs in the form of golden brown granules For tissue growth or repair it provides proteins mineral constituents adequate energy value, and the Accessory Growth Factors or Vitamins in correct nutritive ratio

Children love the deliciousness of Ovaltine" and thrive remarkably well upon this complete food It is of unsurpassable value as a meal time beverage in place of tea, coffee, cocoa or other beverages

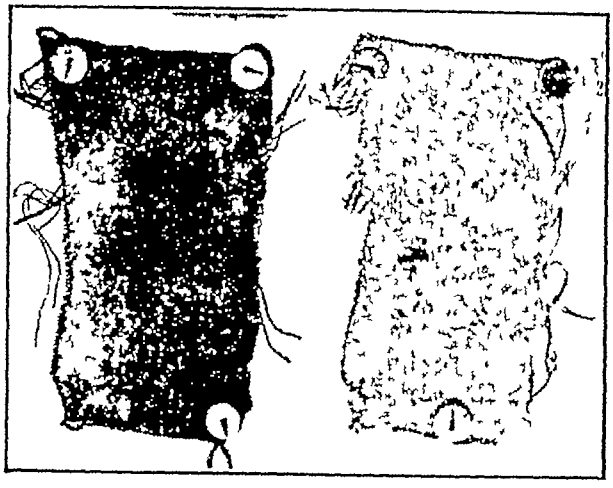
literature provides ample evidence of the many possible applications of the filtered ultra-violet rays in criminal investigation But invisible rays from the other end of the spectrum, infra red rays or heat rays, may be of considerable value to the criminologist The photographs reproduced herewith are, I think, of interest in this respect

On the left is a photograph taken in ordinary light of a piece of blue serge cloth which was being examined for the presence of blood No stain is visible either to the



naked eye or by ordinary photography On the right is the cloth as it appeared when photographed with an infra red plate Now a stain is evident, and this stain, by the usual microscopical, chemical, and spectroscopic tests was proved to be one of blood

I have to thank Professor Glaister of this university for permission to use the photographs —I am, etc ,

Forensic Medicine Department University of Glasgow May 16th F W MARTIN

Mind and Body

SIR —There has been a tendency for many years past to regard the human organism as a rat or a guinea pig is regarded in the laboratory Surely it is time that we all recognized in our work and our hypotheses of disease that our patients have minds, and that this highly civilized part of them has a very strong influence indeed over their bodies

In the *Journal* of May 27th there are two extremely able articles which make very interesting reading , but I feel quite certain that both these articles would be still more interesting and much more valuable if only they were to contain a slight acknowledgement that the mind also comes into the picture I refer to Dr Wilfred Shaw's Treatment of Menstrual Irregularities ' (p 907), and to Dr Norman Burgess s Experiences with Proteose in the Treatment of Diseases of the Skin " (p 914) In the former article there is a paragraph headed " Metropathia haemorrhagica The results of treatment are given as not satisfactory ' though theoretically correct " May I suggest that the reason is that treatment of this sort does not remove the fear of pregnancy which is the real cause of the condition Dr Wilfred Shaw with his wide experience of suffering women must have had to recognize this frequently All general practitioners meet it continually Why do they not admit this state of affairs at least to their own reasoning? Unless we all begin to think fairly we shall never get further than ' hover at the fringe of a complete understanding of these ovarian abnormalities To my mind the last sentence of Dr Shaw s article should read In future it is more than probable that psychotherapy will be the method of choice in the treatment of many cases of this kind "

Is it not time that we as a profession preaching prevention rather than cure, began to teach our patients how best to control their bodies by true harmony of mind rather than how we, by surgical amputations, can try to free them from the anxieties and fears that so often cause their symptoms? Asthma is surely an instance of an anxiety disease Let us admit it and research in that direction, rather than experiment by injecting the abnormal excretions that the body is trying so hard to get rid of We all rejoice with Dr Burgess that he is getting good results, but is he not beginning at the wrong end?

All through the medical, and even surgical, literature of the day one can see our great profession blinding itself at the outset by thinking in terms of the physiologist or pharmacologist, or bacteriologist, doing experiments on animals, instead of starting as a humanist and admitting the very powerful influence of an anxious mind over the body in which it works Many instances occur to one and, indeed, to all of us, but it is not part of the scope of this letter to recount cases of my own experience but rather to express a hope that the profession generally may be stimulated to reorientate its views on disease in the light of recent psychological work —I am, etc ,

Cambridge May 29th C M BILLINGTON, M D

Treatment of Compound Fracture of Femur

SIR,—In your issue of May 27th (p 942) is an account of an action against a surgeon for negligence in the treatment of a compound fracture of a femur In the course of his evidence for the plaintiff, Mr Brockman is stated to have given his opinion that the correct treatment of a compound fracture of four days' duration is excision of the wound I have no more right than he—as neither of us saw the case at the time when the proper treatment was in question—to offer an opinion as to the treatment best for this individual case, but I venture to think such a view ought not to be spread about by the medical press

It is, fortunately, not a common experience to have to undertake the treatment on the fifth day of a compound fracture of a long bone in civil practice All cases in my practice seen within twenty four hours of the accident are cleaned and excised If Mr Brockman had any experience of casualty clearing station surgery in the war I feel sure he would agree with me that late excisions which were at times attempted, were a failure In advocating such a procedure Mr Brockman loses sight of the aim of excision, which is to obtain primary union and to convert an open fracture into a closed one

It was stated by the defendants and by witnesses for the defence that when the patient was admitted to the home his wounds were " very dirty " Does Mr Brockman advocate closure of such wounds? If not excision would be merely meddlesome I am sorry to have to disagree with what is reported as Mr Eccles's evidence for similar reasons When he states that he would excise in the presence of mild sepsis four or five days after an accident he is at variance with me on a question of surgical principle which cannot be a matter for discussion

Of course, one cannot take in the whole of a case by merely reading a newspaper report there were several points in the case which to me were not clear—the chief being why the admittance of the patient to the nursing home was delayed till the fifth day, and what treatment in the way of reduction and immobilization had previously been carried out or attempted Counsel for the defence seems to have ignored these points

The larger question as to the calling of expert evidence by both sides in such a case seems to me to be again brought into prominence by this verdict I submit that the present method is against the public interest and derogatory to the reputation of the medical profession

London W June 5th C H FAGGE

"Sunshine Roof" Rheumatism

SIR —With the advent of warmer weather and spells of sunshine the motorist is making full use of his sunshine roof which is now becoming a standard fitting on all saloon cars large and small If the weather is really warm he will also discard his headgear and enjoy to the full the fresh air and sunshine In common with all new ideas which are on the whole an advance and largely beneficial the sunshine roof brings its little drawback which in my small experience is becoming fairly common—namely a subacute rheumatism affecting the musculature of the back between the scapulae

The victim who is usually quite unaware of the cause of his trouble complains of a mild but annoying muscular ache between the shoulder blades which is more marked during rest when the head is rested on a pillow in the lateral recumbent position It is usually the healthy young owner-driver who suffers—the man (or woman) who is keen on motoring and who sits up to the wheel when driving The passenger who sits back against the cushions rarely complains and often the small protection offered by the brim of a hat is enough to ward off the unnoticed but causative back draught

The cause of the rheumatism once discovered the cure soon follows and the sunshine roof motorist either wears a hat or pulls the sliding roof forward an extra foot and sits back in his driving seat Iodex radiant heat and massage soon settle the condition if further treatment is required

In spite of these observations I am an enthusiastic user of a sunshine roof and believe that it is a most necessary fitting to the modern saloon car which has so completely ousted the old fashioned open tourer —I am etc

Colwyn Bay June 1st. DONALD I CURRIE

South African Medical Congress

SIR —In the *British Medical Journal* of March 11th this year you were good enough to publish a letter of mine expressing the hope that some members of the British Medical Association in England and elsewhere might be tempted to attend the twenty seventh Annual Medical Congress to be held in Capetown September 25th to 30th and assuring them of a warm welcome should they do so In response to that letter I have had several inquiries as to the possibility of obtaining some reduction of shipping fares and special terms for those attending the congress at certain hotels in Capetown I have been able to do both these things

Visitors to the congress can leave England and return as follows *Armadale Castle* leaving Southampton August 4th or by the *Windsor Castle* leaving Southampton August 25th and return by the *Windsor Castle* leaving Capetown October 6th The first-class return fare will be £90 and the second-class return fare £60 The second class accommodation on these ships is extremely comfortable and no one need hesitate to travel by it These ships belong to the Union Castle Company of 3 Fenchurch Street London The Ellerman Bucknall Company of Leadenhall Street have monthly sailings of very comfortable one-class ships and the return fare is £72 —I am etc

Medico-Legal

NEGLIGENCE OF A SUBORDINATE
THE SURGEON AND THE THEATRE TEAM*

The surgeon performing an operation relies on his highly trained team to fulfil many vitally important duties The question of the extent to which he is responsible for a negligent act by his anaesthetist assistant or nurse may therefore at any moment call for an answer Considering the thousands of operations performed in this country every week it is astounding that the hundreds of volumes in which English cases are reported contain no judgement by which this responsibility is measured and hardly even a dictum from which it can be inferred Judges seem to have been rather careful to avoid expressing a definite opinion on this important and difficult matter There is on record however a case which originated in a South African hospital and was heard by the Appellate Division of the Supreme Court of South Africa The judgements given in this case are not of course binding on an English court but they represent the opinions of three lawyers of great learning and experience This was the case of Van Wyk *v* Lewis (1924)

A girl was taken suddenly ill and her general practitioner found her to be suffering from acute cholecystitis He advised an immediate operation and called in an eminent consulting surgeon who performed the operation in the nearest hospital at midnight He was assisted by an anaesthetist and by a qualified nurse on the hospital staff who acted as theatre sister The operation was a most difficult and anxious one the gall bladder was in a very bad state and its substance was so friable that it would not hold the sutures The condition of the patient was critical and the anaesthetist warned the surgeon to get her off the table as soon as possible At the end of the operation the surgeon searched for swabs as carefully as he could but was chiefly concerned with closing the abdomen and getting the patient off the table The patient made a quick recovery and the wound healed over Some months afterwards it broke again and discharged some gall stones and about a year after the operation she passed by the bowels an object which was undoubtedly a small swab with tape attachment She sued the surgeon for negligence and claimed £2 000 damages The judge of the inferior court found against her and she appealed

The court first disposed of the contention of the patient's advisers that to leave a swab in the abdomen was itself proof of negligence and that the surgeon must pay damages unless he could prove that he had not been negligent Chief Justice Innes held that on the contrary all the facts must be considered and that the patient must prove the negligence The court quoted the words of Beven on Negligence

Prima facie to sew up a sponge or an instrument in a patient after an operation is negligence Very great care and method is to be observed in accounting for all appliances used and this in proportion to the easiness with which they may escape observation but even here the fact that some needle or portion of an instrument has been left in a wound is not conclusive but the conclusion from the fact must be determined by a jury on a view of the whole circumstances

Wessels Judge of Appeal said Since all the surrounding circumstances are to be taken into consideration there is no room for the maxim (namely *res ipsa loquitur* which means that the fact is itself adequate evidence of negligence) The case hinged on whether the surgeon was entitled to depute to an assistant the task of counting and checking the swabs or whether he did so at his own risk and if she (the assistant) made a mistake was responsible for her negligence Judge Kotzé said The operating surgeon no doubt has control of the operating room or theatre and circumstances may arise where he *may* become liable for the acts of the nurse or sister in attendance

The evidence had established that by the procedure of the hospital the duty of counting all the swabs and particularly of keeping a tally of those used inside the body and checking them as they came out was entrusted to the

* The first part of this article on Negligence of a Surgeon to be by a legal correspondent appeared in the *Journal* of April 29th (p 766) and the second part, dealing particularly with nursing homes and co-operations and the paying patient, on May 27th (p 941)

HORLICK'S MALTED MILK

for close upon fifty years has been used with success in the dietetic treatment of diseases of childhood—digestive disturbances, respiratory conditions and infectious diseases generally

It is a modified milk, easily digested and absorbed, with a proportion of protein adequate for nutritive requirements Physiological tests have shown that its carbohydrates —lactose, maltose, and dextrin— have a high degree of assimilation They are well utilized, and have a considerable "protein-sparing' and antiketogenic value.

Horlick's will be found to be especially valuable for children who are unable to tolerate fatty food, or who suffer from faulty fat metabolism—the nervous child and those who are constipated, debilitated liable to so-called biliousness or attacks of cyclic vomiting

A Really Effective Treatment for Nasal Catarrh.

ANTIBACSYN

The Universal Anti-infective Agent

Time-honoured methods of treating chronic nasal catarrh having proved consistently unsatisfactory the practitioner must welcome an agent which has been found to be definitely curative in many cases

That Antibacsyn fulfils this claim has been established by many case reports received from physicians The injection of Antibacsyn powerfully stimulates the production of substances antagonistic to bacteria of all kinds It is therefore, more effective than vaccines prepared from a more or less haphazard selection of organisms What is more, no anaphylactic reactions have been observed from its use

Antibacsyn can be employed with equal effect in all kinds of bacterial infections from the acute specific fevers to chronic conditions such as pyelitis or cystitis

A copy of our new booklet giving full particulars as to dosage etc., will be gladly sent on request.

Antibacsyn is manufactured in the laboratories of

How Lactogen Standards are Maintained

Fat and Protein Content Tests

Since the high nutritive value of Lactogen is due largely to its ready digestibility, it is very important that the degree of modification of the fat and the curd shall be rigidly consistent.

Systematic tests are made with the reconstituted product in the Lactogen Laboratories, to ensure that the homogenisation of the fat and the flocculency of the curd equals that of the approved Lactogen standard.

Lactogen furnishes a fat allowance comparable to breast milk. The special Lactogen emulsifying process ensures a very fine and widely-dispersed division of the fat globules, so that Lactogen is very easily digested and may be freely prescribed for even the most delicate infant. The fat content of Lactogen is maintained with meticulous accuracy by scientific control of the modification process

Lactogen is a modified dried milk for use in infant feeding—prepared in England by Nestle's, from the rich, pure milk of selected English herds

sister The court held that this practice was reasonable—the sole test of whether the surgeon had used due care On the question of whether the theatre sister was the servant of the surgeon in the sense that he was responsible for her negligence the court expressed a most important opinion Wessels, J A , said

' The relation of a hospital sister or nurse in a public hospital to a surgeon operating in that hospital is not that of master and servant nor is it analogous to such a relationship The sister or nurse is an independent assistant of the surgeon though under his control in respect of the operation The truth is that hospital sisters and nurses form a distinct branch of the hospital They are members of an allied profession and have duties of their own to perform They are subordinate to the surgeons, but they are in no way their servants The surgeon does not insure that he will be responsible for every misfeasance of the nurse To make him so would make his position intolerable "

Speaking of the practice of the profession, he said

' In determining whether a surgeon conducting an abdominal operation in a hospital is entitled to place reliance on the counting of the swabs by a qualified and competent hospital sister we must consider the prevailing practice of the profession and all the circumstances surrounding the operation In operations some team work is essential to what extent the doctor should or should not rely upon the team work of the hospital assistants depends entirely on the nature of the particular case '

He quoted the words of an American annotator " If the surroundings are those of a modern hospital with experienced nurses and attendants, the doctor ought to be entitled to take for granted that they will attend to their ordinary duties without instruction " He said

This appears to me both common sense and sound law in this country [South Africa], taking into consideration modern conditions and modern methods of operating in hospitals The Court of Appeal affirmed the judgement of the court below Here are three learned Dominion judges expressing the emphatic opinion that a surgeon is entitled to rely on expert assistants in an operation and is not to be held personally responsible for every act of those assistants The extent of his responsibility, they suggest will vary in each particular case, but he is not unconditionally responsible, and the fact that a mistake has been made and an appliance has been left in the patient s body will not in itself prove that either he or a subordinate has been guilty of negligence Whether in the circumstances negligence has been committed is a matter for the jury to decide

In March 1930, the Lord Chief Justice, sitting with a special jury heard the case of Crotch *v* Miles, in which a woman claimed damages against Mr Ernest Miles on the ground that he had left a pair of forceps in her abdomen at an operation he had performed ten years before This case was not reported in any of the series of legal reports but a full account appeared in the weekly medical journals [1] The evidence established that, since the operation by Mr Miles the patient had undergone another operation in France Mr Miles gave evidence that he invariably exercised scrupulous personal care in counting all instruments and appliances after an operation and had devised a system by which both he and his theatre sister counted the instruments in multiples of three It appeared that at operations in France no count is made either by the surgeon or by the assistant The jury came to the conclusion that the forceps had not been left in the patient s body at the operation performed by Mr Miles and so the question of the surgeon s responsibility for his assistants at an operation was not a main issue Nevertheless in the course of this case Lord Hewart made several interesting observations which may fairly be taken to represent the attitude of the common law towards a surgeon who accidentally allows an appliance to remain in the body of a patient They show moreover the essential contrast between his attitude and that of the African judges Whereas these judges were concerned with whether a surgeon, generally speaking, should be responsible *in law* for a mistake by his assistant, Lord Hewart was concerned in all he said with asking the jury whether it thought *on the facts* of this particular case that the surgeon had been negligent

Referring to the judgement in Hillyer s case, Lord Hewart said that the operation staff had been held not to be the servants of the governors but, he said it did not follow the other way round that the nurses assisting at the operation were the servants of the surgeon In his summing-up, he said that nobody denied that if a surgical forceps was left in the body of a patient in the course of a surgical operation, that patient ought to have a remedy in damages against somebody—in other words, the case is one where *res ipsa loquitur* He quoted the evidence of Sir Hugh Rigby a surgeon, that in England the theatre sister was exceptionally responsible and highly trained, and that according to the usual practice she was charged with the duty of counting instruments and swabs He very properly left the decision to the jury whether on the evidence in the particular case assuming that the forceps had been left in the body at Mr Miles s operation, it considered that the surgeon was ultimately responsible He recalled that Sir Hugh Rigby had said it was in the interests of the patient that the duty of counting should be left to the sister Sir Thomas Horder (as he then was) had said that he regarded the surgeon as ultimately responsible, and that the surgeon should check the count at the close of the operation Lord Hewart s words to the jury were

" You may think it is right to draw a distinction between what is done in the course of the operation and what is done immediately at its close It may well be that in the actual course of the operation while the surgeon is cutting and opening and attending to his surgical task it is not to be expected nor desired that he should be busying his mind with the counting of instruments and swabs or with the question of whether a swab or instrument is missing But you may think that other considerations apply at the close of the surgery itself It may well be that any delay might be highly prejudicial if it occurred before the body of the patient was stitched up but after that you may think that before the surgeon departs it is reasonable that he should personally satisfy himself that the number is correct and that there is nothing missing

" Was it in November 1920 part of the duty of the surgeon personally to count the instruments and satisfy himself that the number was correct or was he entitled to say that there was present a skilled theatre sister that this was her job, and that he was entitled to act upon her report? She is not his servant she is one of the team We can all make mistakes I suppose it is quite conceivable that somebody in an individual case might miscount a certain instrument You have to address your minds to this question suppose the theatre sister did miscount and thought there were six of these instruments when there were only five is the defendant responsible for that happening? Is it a breach of duty on his part that the theatre sister made that mistake? You may think it is linked up with the question as to what he did afterwards

It was in some ways a pity that the question was not a main issue of the action From the words of the Lord Chief Justice it seems doubtful whether an English court will ever commit itself to an unconditional ruling that the surgeon at an operation can leave the counting of instruments and swabs entirely to the theatre sister and be relieved of all responsibility Lord Hewart hinted strongly that however urgent it may be to get a patient sewn up and off the table the surgeon can reasonably be expected to count his instruments and appliances afterwards In any event the matter rests with the jury to decide on the evidence in the particular case

Attempts have sometimes been made to hold the surgeon responsible together with the anaesthetist if mishap resulted from the administration of the anaesthetic but there appears to be no record of any case in which their respective liabilities have been defined In Hillyer s case Lord Justice Farwell made some remarks about the surgeon being in supreme command at an operation, but these remarks were not directed towards the point at issue—which was the liability of the hospital for injury to a patient at an operation—and were, therefore in the nature of *obiter dicta* and not binding on other judges It is difficult to see how a surgeon can possibly be held responsible for the proper administration of the anaesthetic As a rule the anaesthetist is neither his servant

[1] *Brit. Med. Journ.* 1930, i, 620 *Lancet* 1930, i, 643, 706

nor his servant but an independent contractor upon whose skilled collaboration and assistance he depends If however the selection of the anaesthetist has been left to the surgeon he would probably be held to owe the patient a duty to exercise reasonable care in selecting a competent anaesthetist A surgeon who consents to operate with an anaesthetist whose competence he has reason to doubt probably does so at his own risk

STUDENTS IN A TEACHING HOSPITAL

In a teaching hospital it is part of the training of students to perform subordinate duties such as dressings passing catheters taking specimens of blood and treating minor ailments and injuries in the casualty department The question may at any time arise Who is responsible for injury resulting from lack of reasonable skill or care in a student? The question is not an easy one The governors of the hospital contract with the medical school to give facilities to students to learn their craft within the hospital under the direction of the visiting and resident physicians and surgeons The hospital governors do not exercise any control over the students who learn within the walls of the hospital Nevertheless one of the duties of the hospital to its patients is to protect them or warn them against any dangers they may encounter in the hospital In certain circumstances the ministrations of the student may conceivably be quite dangerous and the question arises whether a patient who enters a teaching hospital of his own will knowingly and willingly takes the risk of being attended in some circumstances by a student There is no explicit guidance in either the law reports or the textbooks and the legal liability would probably vary according to the particular case It seems reasonable that the hospital or the teachers should be liable for any injury caused by the delegation to a student of a duty which he could not reasonably be considered competent to perform On the other hand the governors are never in a position either to control the student or to decide what duties may be properly delegated to a student in any particular case This seems to be peculiarly a matter of professional skill within the compass of the medical staff alone and outside the interference of the governors altogether The inference is therefore that if harm happens through a student being given a task that is in the view of a reasonable man beyond his capacity the liability should rest on the person who appointed him to that task If however a student who was considered on reasonable grounds fit to perform a certain task caused injury by performing it negligently it does not seem good law that the teacher who ordered him to perform it should be held responsible unless he was present and in a position to control the student If the qualified medical staff were liable for isolated acts of negligence by students in their absence clinical teaching would be very seriously hampered if not brought to a standstill altogether When a member of the staff is present and in a position to exercise control the position is different he would then it is submitted have to answer for any injury due to the student's lack of due skill and care

THE QUALIFIED ASSISTANT THE LOCUMTENENT AND THE TECHNICAL EXPERT

Applying the principles laid down in the textbooks and in the cases that have been cited it appears that a medical man in private practice contracts to treat his patient with reasonable skill and care and can only delegate these duties with the consent of the patient If however the patient consents to be treated by a qualified assistant or locumtenent the doctor's duty ceases when he has exercised reasonable skill and care in selecting a competent qualified assistant or locumtenent and he will not be responsible for any isolated act of negligence by such a person Whether the patient has consented must be a matter of fact a patient's consent need not be given in so many words but may sometimes be implied from the fact that he has allowed the substitute to treat him When however a busy medical man finds he cannot pay a certain visit and sends his assistant or locumtenent instead he may put the patient into a position in which he has to choose between putting up with the substitute and going without treatment altogether In such a case the jury is not likely to regard the patient's acquiescence as consent and the substitute will be in the position of the doctor's agent for whose negligence he (the doctor) is responsible If a medical man benefits financially by the work of another there is at any rate a presumption that the other is his agent. It is worth noting that a panel doctor by the form of his contract with the Insurance Committee undertakes liability for his assistant's failure to give a patient proper care and attention

On the other hand when a doctor prescribes expert treatment to be carried out with the consent of the patient by a medically unqualified person skilled in that treatment such as a registered biophysical assistant—a qualification which implies competence in many kinds of treatment such as massage electrotherapy and hydrotherapy—he is not responsible for specific acts of negligence by such persons if he has good reason to believe that they are competent to carry out the treatment which he has prescribed and if it is the custom of the profession to delegate such treatment to such persons He has discharged his duty when he has exercised due care in the selection of an assistant or independent expert competent to perform the task in question If however a subordinate is performing a duty in his presence and he is able to exercise control he may be liable for that subordinate's negligence Whether a given person was in fact a subordinate and whether the doctor could properly have exercised control is a question for the jury in the particular case

Under the Partnership Act 1890 (Sections 10 and 12) each partner in a firm is liable for the misdoings of the others in the firm's ordinary business If therefore one of the partners in a medical firm is so unfortunate as to have damages given against him for negligence any of the others may be made to pay the whole of the amount If the injury was caused by fraud or culpable negligence the offending partner may in some cases be ordered by the Court to indemnify the others but he may not have the means to do so Every member of a partnership would therefore be well advised to insure himself against the risk of being held liable in damages for the act of another practitioner over which he cannot exercise the slightest degree of control Even if his partners are absolutely competent and trustworthy juries are not

* Since the three parts of this article on Negligence of a Subordinate were written Mr H C Dickens barrister at law has delivered a valuable lecture to the Medico-Legal Society entitled Negligence in Hospital and its Legal Consequences in which he dealt with some of the same points and with certain others This paper will in due course appear in the *Medico Legal and Criminological Review*

Universities and Colleges

UNIVERSITY OF OXFORD

At a congregation held on June 3rd the degree of Doctor of Medicine (D M) was conferred on F Hawking

UNIVERSITY OF BRISTOL

Dr Geoffrey Hadfield F R C P Professor of Pathology in the University of London (Royal Free Hospital London School of Medicine for Women) has accepted an invitation to fill the Chair of Pathology shortly to be vacated by Professor Walker Hall

Dr J W de W G Thornton has been appointed Lecturer in Pharmacology and Mr J D A Gray senior Pathological Officer in the Department of Preventive Medicine

UNIVERSITY OF SHEFFIELD

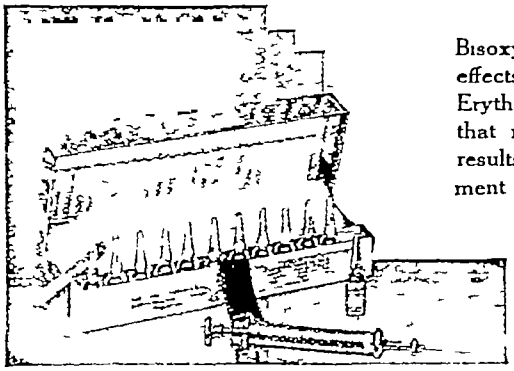
At a congregation on July 1st the honorary degree of Doctor of Science will be conferred upon Professor J B Leathes F R S Dean of the Faculty of Medicine and upon Mrs May Mellanby

UNIVERSITY OF ST ANDREWS

Mr Francis Robert Brown M B Ch B F P C S Ed has been appointed a lecturer in clinical surgery in the University

BISOXYL

The treatment of syphilis by the intramuscular injection of Bisoxyl an aqueous suspension of Bismuth oxychloride in a very fine state of sub-division is now regarded as a matter of ordinary routine in V D Clinics



Bisoxyl has been used with beneficial effects also in the treatment of Lupus Erythematosa a physician stating recently that in his experience very satisfactory results follow its injection in the treatment of this condition

Bisoxyl is issued in ampoules of four sizes and in rubber-capped vaccine bottles ready for immediate use.

For patients lacking tone

The physician is often called upon to prescribe for patients suffering from no specific infection but who are in a general condition of subnormal health In such conditions the administration of Livogen is proving to be remarkably beneficial.

A well-known woman doctor reporting recently on her experience with this unique revitalising tonic, stated that she prescribes it regularly *as a pick me up for patients lacking tone and for general lassitude it gives excellent results in a certain form of debility which does not respond to iron or the usual tonics*

The value of Livogen lies in the fact that it contains in generous proportions all the blood-regenerating constituents of fresh liver together with haemoglobin (for the supply of iron in readily assimilable form) and a measured amount of the vitamin B complex which, in addition to promoting a stimulus to the appetite and preventing constipation is now known to act beneficially in all anaemic conditions

Medical Notes in Parliament

[FROM OUR PARLIAMENTARY CORRESPONDENT]

The Unemployment Insurance (Expiring Enactments) Bill was introduced in the House of Commons on May 31st It is a Government measure which proposes to continue for twelve months the Unemployment Insurance Act, 1930, and Sections 1 and 2 of the Unemployment Insurance (No 3) Act, 1931 The second reading is put down for June 14th

The House of Commons will reassemble on June 13th The report and third reading of the Pharmacy and Poisons Bill is set down for June 15th The Bill has already passed the House of Lords

Hospitals and the Tax on Co operative Societies

On May 30th, in the House of Commons the Finance Bill was further considered in committee A new clause moved by Mr HORE BELISHA imposing a charge of income tax on mutual profits of any company or society was read a second time by 253 votes to 77

Mr CAPE moved an amendment to exempt from income tax any profit or surplus allocated by a society to hospitals, convalescent homes or welfare centres He understood from the Chancellor of the Exchequer that donations by societies to such institutions would be on a similar basis to donations given by individuals or companies But he understood that an individual or a company had to give a seven years guarantee that the donation would be paid to these institutions before being able to claim exemption If that was so the case of these societies would not be met because it was very difficult for a mutual trading society to give a guarantee for that length of time most of these societies were run on democratic lines and every half year the meeting of members decided what donations of this kind should be made Having been a general secretary of one of these societies himself he could say that they generally paid something to the hospitals and convalescent homes in the locality every year for the benefit of their people For three or four years they gave a substantial grant to one or two hospitals not only in their own area but outside as well because of the specialist treatment given to their people This year, however owing to so many men being unemployed and their revenue having much decreased they had to reduce their donations to the hospitals The same thing applied to other co operative societies

Mr LOGAN said that it was important in hospital and convalescent treatment for a patient to be able to get out of his own neighbourhood and a wonderful opportunity would be afforded if a big society with 6 500 000 members was in a position to provide additional benefits out of its surplus funds Owing to the great amount of poverty many thousands of people would be turned off health insurance this year Here was an opportunity for the co ordination of the health services of the nation with the work that the co operative society was able to do The expenditure on Poor Law would be relieved by the grants that could be given not only for the relief of distress but for convalescent treatment and after care Mr PRICE appealed to the Chancellor of the Exchequer to give consideration to the matter because it was bound to affect the finance of hospitals all over the country

Government Reply

Mr CHAMBERLAIN Chancellor of the Exchequer said he could not accept the amendment He hoped that the answer he would give to the points raised would satisfy hon members and reassure them as to the fears which had been expressed There had been some misunderstanding on two points He had not said that co operative societies in this respect would be in the same position as private individuals he had said that they would be in the same position as trading companies—quite a different thing The seven year guarantee was something which applied only to subscriptions by private individuals there was no question of the seven year guarantee in considering what had to be allowed as a trading expense or in computing the profits or gains of a trading company To put the matter quite broadly and generally if donations or subscriptions to hospitals and other institutions referred to in the amendment were made for the welfare of the employees of the co-operative society or company they would be admissible as a trade expense In the case of hospitals the question would be whether those hospitals were available for the welfare of the employees If that was the case subscriptions or donations would not be subject to taxation, although they might be taken out of the surplus of the society But with regard to donations or subscriptions—for example by a Yorkshire co operative society to a hospital in London—one could hardly say that that was in connexion with employees of the society and he did not think that they should be permitted as a trade expense

Mr LOGAN asked if the Chancellor would agree that in the case of a company or society in say, Yorkshire or Lancashire, subscribing to a specialist hospital to which they could send a patient even though it might be in the South of England that would be within his description Mr CHAMBERLAIN answered Certainly It is not necessarily a question of the locality The test is whether it is for the welfare of the employees It would of course in the ordinary case be a local hospital, but a subscription to a specialist hospital which was not necessarily in the locality would come within the exemption

Sir S CRIPPS said he was afraid that what Mr Chamberlain had said would not in the least meet the point which the Opposition desired to put forward The right hon gentleman had stressed quite rightly and accurately that all these various payments must be made on behalf of employees and that of course was the existing law as regarded other companies But co operative societies were concerned with payments made on behalf of members and not of employees and the position as he saw it was this a co operative society had a surplus available and in order to provide hospital accommodation for its members made a large donation to a local hospital The members had the alternative of taking the money in dividend or of benefiting the hospital Surely it was a proper and right use of the money on exactly the same basis as the use of the money for dividend

The amendment was rejected by 231 votes to 66

Stamp Book Advertisements —Answering Mr Sutcliffe on June 2nd, Sir KINGSLEY WOOD said that revenue from advertisements of patent medicines in the stamp books was about £530 per annum of which about £30 per annum was from advertisements of medicines for certain diseases referred to in paragraph 58 (2) of the Report of the Select Committee on Patent Medicines In view of the committee's recommendations he had decided that any future contract for the exploitation of advertisement space in the stamp books should prohibit acceptance by the contractor of any advertisement for a patent medicine the terms of which suggest that the medicine had a beneficial effect in respect of the diseases listed

Obituary

Dr T BURNS MOYES, who died at the early age of 40 was well known as a general practitioner in Hull where he had many friends especially among the poorer classes He was born in Calcutta and studied medicine at the University of Edinburgh, graduating M B B Ch in 1918 During his undergraduate days he was president of the Royal Medical Society of Edinburgh and after qualifying held a number of resident posts at the Edinburgh Royal Infirmary In the early part of the war he served with the 28th Brigade R F A, and afterwards as a temporary captain R A M C At Hull he was medical officer to one of the River Boards, and medical referee for the central district in connexion with the examination of superannuated employees of the corporation

Medical News

The summer dinner of the Australian and New Zealand Medical Association in England will be held at the Trocadero Restaurant Piccadilly on Friday June 16 h at 7 45 for 8 p m with Mr L Graham Brown F R C S in the chair Sir Thomas Wilford High Commissioner for New Zealand will be the official guest All medical visitors from Australia and New Zealand whether members of the association or not are cordially invited to be present The honorary secretaries are Mr E T C Milligan and Mr Philip Jory (26 Queen Anne Street W 1)

The annual general meeting of the Paddington Medical Society will be held on Tuesday June 13th in the Great Western Royal Hotel Paddington at 9 p m when the presidential valedictory will be delivered by Dr G de Swietochowski and officers for the coming year appointed

The British Institute of Philosophy announces that an address will be given by Sir Herbert Samuel entitled The Tree of Good and Evil at University College Gower Street on Wednesday June 14th at 5 15 p m A limited number of seats are available for the public and applications for tickets should be made to the director of studies University Hall 14 Gordon Square W C 1

The St Cyres Lecture for 1933 on Some Observations on Coronary Thrombosis will be delivered by Professor John Hay at the National Hospital for Diseases of the Heart Westmoreland Street W 1 on Tuesday June 13th at 5 p m All members of the medical profession are invited to attend

At the Princess Elizabeth of York Hospital for Children Shadwell E to-day (Friday June 9th) at 8 45 p m Dr A. P Cawadias will give an address on Hippocrates and Hippocratic Principles of Practice in Contemporary Medicine Dr A M Gossage will preside Visitors are welcomed

The second of four advanced lectures for post graduates arranged by the Fellowship of Medicine and Post Graduate Medical Association will be given on June 14th at 5 p m at the Medical Society of London 11 Chandos Street W by Dr C P Symonds on The Disturbance of Cerebral Function in Head Injury A course in diseases of the chest will take place at the City of London Hospital Victoria Park from June 12th to 24th On June 26th at 8 30 p m at 11 Chandos Street Dr Roland de Hellebranth of New Jersey U S A will deliver a lecture on Modern Methods of Local and Spinal Anaesthesia illustrated by lantern and cinema There will be a practical week end course in general medicine and surgery at the General Hospital Southend on-Sea on July 8th and 9th On June 16th at 5 p m there will be an ante natal demonstration at the Royal Free Hospital Forthcoming courses include cardiology at the National Hospital for Diseases of the Heart June 26th to July 8th diseases of children at the Children s Clinic June 26th to July 8th

A joint conference of the British Hospital Association and the Incorporated Association of Hospital Officers is being held at Bath during the last three days of this week An opportunity will be afforded for viewing officially and in detail the new Bath Royal United Hospital which has lately been completed at a cost of £150 000

The annual congress known as the Journées médicales de Bruxelles will be held at Brussels under the presidency of Professor Valère Cocq from June 24th to 28th when syphilis will be the principal subject for discussion The subscription is 100 francs which should be sent to the general secretary Dr Beckers Rue Belliard 141 Brussels The inaugural address will be given by Professor Charles Saroléa on The Doctor and Medicine in European Literature Excursions and amusements have been arranged for visitors and on June 28th members are invited to the official inauguration of the Palais des Thermes at Ostend

The fifth congress of the International Society of Urology will be held at the Royal Society of Medicine 1 Wimpole Street W from July 10th to 15th under the presidency of Sir John Thomson-Walker

Lord Melchett has accepted the presidency of the British Science Guild in succession to Sir Samuel Hoare whose three year term of office ends in June 1933 Lord Melchett will be formally elected at the annual general meeting to be held in the Mansion House on June 19th at 4 30 p m with the Lord Mayor of London (Sir Percy W Greenaway) in the chair

Dr B Holroyd J P of Pannal near Harrogate has been elected chairman of the Claro Guardians Committee of the West Riding County Council for the fourth year in succession

We have received the first issue published in March of a new monthly Spanish journal entitled *Revista Medica de Toledo* edited by Dr J Ruiz de Guardia It contains original articles on nervous syndromes and hepatic opotherapy by Professor G Marañon treatment of infantile paralysis by irradiation of the spinal and peripheral sympathetic system by Dr A Piga and the causes of error in the determination of age by the measurement of the Haversian canals by Dr Daniel Ortega

A meeting of the Physiological Society will be held in the Physiological Laboratory of the School of Medicine Leeds to-day (Saturday June 10th) at 3 p m On July 1st the society will meet in the University Laboratory of Physiology Oxford

We have to announce with great regret that Sir Walter Fletcher died on June 7th after an operation

Letters, Notes, and Answers

All communications in regard to editorial business should be addressed to **The EDITOR, British Medical Journal B.M.A. House Tavistock Square W C.1**

ORIGINAL ARTICLES and LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone unless the contrary be stated Correspondents who wish notice to be taken of their communications should authenticate them with their names not necessarily for publication.

Authors desiring REPRINTS of their articles published in the *British Medical Journal* must communicate with the Financial Secretary and Business Manager British Medical Association House Tavistock Square W C 1 on receipt of proofs Authors overseas should indicate on MSS if reprints are required as proofs are not sent abroad

All communications with reference to ADVERTISEMENTS as well as orders for copies of the *Journal* should be addressed to the Financial Secretary and Business Manager

QUERIES AND ANSWERS

Sequels of War Gassing

YOUNG G P asks where he can find some authoritative information as to the sequelae of being gassed in the war At least 30 per cent of my male patients (he writes) who were combatants in the war and who are now in an industrial practice blame the effect of poison gas on the lungs for their bronchitis thoracic aches and pains asthma tuberculosis etc All the patients are emphatic in saying they were in perfect health before the war and have never been thoroughly fit since their poison gas experience What and where are the facts?

The "Allenburys"
"CHARKAOLIN"
GRANULES

"Charkaolin" is a highly efficient agent for the treatment of intestinal infections characterized by abnormal fermentation and the formation of toxins It combines the absorbent properties of highly activated vegetable charcoal with the well-known toxin adsorbing qualities of "Osmo Kaolin

It is in the form of fine, clean granules which disintegrate rapidly in water and diffuse their ingredients evenly throughout the liquid "Charkaolin" is tasteless, forms a fine suspension in water and is, therefore, quite easy to take

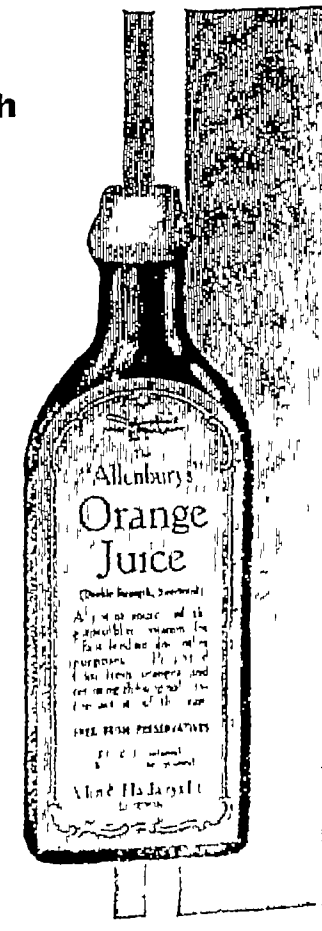
Descriptive literature and a clinical trial sample will be sent on application.

ALLEN & HANBURYS LTD.

Telephone— Bishopsgate 3201 (12 lines) **LONDON, E.2.** *Telegrams*— Greenburys Beth London"

Double Strength Sweetened

"Allenburys"
Orange Juice



Supplies a potent source of the anti-scorbutic Vitamin C in a form convenient for infant feeding and other purposes

It is equivalent to *double strength* fresh orange juice and retains its full activity for a long period

Employed with advantage in all cases in which fresh orange juice is used

May be taken by children and adults in the form of a delightful drink by diluting with about ten times its volume of plain or aerated water or milk

Contains no alcohol or chemical preservative

Further particulars and clinical sample will be sent post free on application

Allen & Hanburys Ltd., London, E.2

Telephone 3201 Bishopsgate (12 lines). Telegrams "Greenburys Beth London"

Myositis Ossificans Progressiva

'HELP' writes A sturdy child of 7 years has developed myositis ossificans progressiva involving chiefly the flat muscles of the back, which are all becoming masses of bone The axillary and neck muscles are also becoming affected so that movements of the head are impossible, and feeding can be achieved only with great difficulty The disease is usually considered hopeless and the sufferer is allowed slowly to become a solid mass of bone Has anyone ever had any success with this disease? Or can anyone make any suggestions? Anything would be tried in a case which, untreated, holds such a hopeless prognosis

Pruritus in Pregnancy

Mr DONALD I CURRIE F R C S (Colwyn Bay) writes in reply to Dr F W Lawson's query under this heading June 3rd p 991) I suggest that he should treat the affected parts by exposure to ultra violet light Two or three exposures at three- or four day intervals are usually all that is required, the patient being placed in the lithotomy position and the parts being well retracted Cold bathing and an antiseptic dusting powder should be used between applications

Income Tax

Board and Lodging of Son Acting as Assistant

"R S" has a son who acts as his locumtenent and assistant, and he claims to deduct as professional expenses "the fees of £7 7s per week as locum and £2 2s as assistant" also £2 2s and £1 1s per week as 'maintenance" expenses The assessor objects to the deduction of £1 1s per week for maintenance as assistant, on the ground that he would have been staying at home in any case

*** The objection does not seem to be well founded If the son does assist in the practice and does in fact receive £2 2s per week in cash and maintenance to the value of £1 1s per week in respect of his services, it seems irrelevant to consider what would have been the position if he were not rendering those services The relationship is also irrelevant unless the value of the emoluments claimed is clearly excessive on a *quantum meruit* basis The amount of the allowances claimed seems reasonable but of course, a lot depends on the facts—that is, on the value and cost of the board and lodging provided

Car Transactions

"MAGNETO'S" car transactions have been as follows

October 1921	Bought car A for £467
December 1926	Bought car B for £130
February 1930	Sold car B for £15 and Bought car C for £165
April 1933	Sold car A for £10 and Bought car D for £180

*** It would have paid "Magneto" better to have claimed the wear and tear allowance throughout, but as it is we advise him to claim the renewal allowance for 1931-2 on car B—that is £130-£15=£115 invoking Section 24 of the Act of 1923 to justify the reopening of the assessment and the repayment of the appropriate amount to him The renewal allowance for car A—that is £180-£10=£170—will affect the profit for the year 1933 and therefore the income tax assessment for 1934-5 The wear and tear allowance should be claimed for 1935-6 and onwards

Allowance for Use of Residence

"M R C S has not practised in recent years She and her husband have now decided to take a house in a suburb M R C S will put up her plate and see whether she can acquire a practice The whole venture is rather in the nature of a speculation' and they are taking a larger house than they would otherwise require so as to be equipped with consulting room etc What expenses can be deducted?

*** The expense of fitting up the consulting room is capital outlay and cannot be deducted but a proportion of the general expenses can be treated as professional It will be a little difficult to fix that proportion because presumably comparatively little use is likely to be made of the consulting room to begin with—we would suggest that one quarter might be claimed

LETTERS, NOTES, ETC

Non differentiation of Abdominal Musculature

Dr NORMAN HOWITT (surgeon to the Yeovil Hospital) writes In view of the rare occurrence of this condition it has been suggested to me that some record should be made The patient a commercial traveller aged 68 was admitted to the Yeovil Hospital with acute appendicitis on January 2nd At the operation a modification of Battle's incision was used, and the following abnormalities of the abdominal wall were revealed There was no linea semilunaris The rectus possessed no separate sheath The rectus and internal oblique did not exist as separate entities The lower quadrant of the abdominal wall was composed of a thick plaque" of muscle, uniform in structure and extending from the middle line to the anterior superior spine and Poupart's ligament, the direction of the fibres being vertical in the mid line and gradually diverging towards the outer side to make their attachment to Poupart's ligament For the purpose of investigation the common aponeurosis was rapidly lifted in both directions to these limits The patient made an uneventful recovery so that no opportunity has been afforded for a more extensive and detailed examination

Simultaneous Herpes Zoster and Varicella in the Same Individual

Dr E B HOLLWAY (Bettiah, Bihar India) writes A lady aged 67 developed a severe attack of herpes zoster of the superior ophthalmic division of the fifth nerve on March 1st 1933 Seven days later she had a slight rise of temperature, followed twenty four hours later by a typical varicella rash over trunk and limbs She had never had chicken pox A garden coolie had had chicken pox fourteen days before her attack of herpes zoster, and her own sister, aged 70, developed the disease ten days later

Artificial Male Urethra

Mr ALEX E ROCHE (London W 1) writes Last December at the West London Hospital, I amputated a penis for urethral carcinoma extending from the external meatus to the scrotum and implanted the urethral stump into the perineum just behind the scrotum Subsequently the patient inquired if he could be fitted with an apparatus to enable him to pass water while standing instead of squatting At my suggestion and request the Genito Urinary Company made a tapering rubber cup about 2 inches deep whose lumen is continued into a rubber tube the length and width of the latter being about 6 inches and ¼ inch respectively The oval mouth of the cup measures about 2½ by 2 inches and has rounded lips for application to the perineum This apparatus (price 10s 6d) enabled the patient at his first attempt on May 11th 1933 to micturate accurately and cleanly while standing into a conical specimen glass without spilling a drop Thus by means of a simple rubber cup and tube this patient is now able to avail himself of the social advantages gratuitously provided by the community, free from the expenses entailed by the squatting position

Mirror Writing

"SINISTRAL" writes Like Dr Richard Bell in his letter on page 947 of your issue of May 27th I was surprised to learn it was not common knowledge that almost anyone with a few minutes' practice can produce mirror writing with his left hand The knowledge is useful for it was a common "tip" in the last war to give to patients with a wound which prevented the use of the right hand And it was uncommon to find one who could not after a little practice write to his friends merely getting someone to hold a note to hold the letter before the mirror

Disclaimer

Dr A C MACIAN writes With regard to the publication in the lay press of certain items highly eulogistic of the work of myself and a colleague in the matter of cancer research and a new line of treatment I desire to state that these have appeared without my consent or approval also that they contain many inaccuracies and are completely misleading as far as my own portion of the work is concerned

Vacancies

Notifications of offices vacant in universities medical colleges and of vacant resident and other appointments at hospitals will be found at pages 40 41 42 43 44 45 and 47 of the advertisement columns and advertisements as to partnerships assistantships and locumtenencies at pages 46 and 47

A short summary of vacant posts notified in the advertisement columns appears in the *Supplement* at page 259

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine

407 Vocal Symptoms in Addison's and Graves's Disease

R SEGRÉ (*Rev Franç de Phoniatrie* January 1933 p 39) claims that certain vocal troubles observed in connexion with the diseases of Addison and Basedow though not exclusive to these maladies or absolutely characteristic are sufficiently frequent to be recognized as a symptom of endocrine derangement The dysphonia of Addison's disease appears in the period of advanced asthenia and pigmentation and becomes progressively accentuated as the malady advances A subjective sensation of fatigue precedes the vocal trouble There is a difficulty in shouting or emitting sharp sounds At this stage the timbre of voice is not altered in quality or strength and laryngoscopic examination is normal Later a diminution of tone occurs which is quite characteristic This is unaccompanied by hoarseness or uncertainty or tremulousness Occasionally the voice is normal in the dorsal decubitus and becomes feeble several minutes after assuming the upright position Suprarenal extract has benefited some cases the cortical hormone having a more durable action than insulin Alteration of the voice may lead to a diagnosis of exophthalmic goitre The case is quoted of a woman of 36 who complained of stammering for about eight years Her voice had become harsh and sometimes raucous her parents had noted that the timbre was more infantile and singing fatigued her She experienced an occasional difficulty in speech—a sensation of being unable to emit the sound There were no associated movements as in stammering and the difficulty was not accentuated before intimidating persons On examination this patient's eyes were found to be slightly prominent Stellwag's sign was present and though the thyroid was not palpable the pulse was 120 and there was slight trembling of the hands Basal metabolism was found to be much above normal

408 Pneumococcal Bronchial Obstruction

As the result of the experimental production in dogs of atelectasis and lobar pneumonia by the injection into the bronchi of human pneumococcal sputum P N CORYLLOS and G L BIRNBAUM (*Arch Int Med* February 1933 p 290) conclude that bronchial obstruction plays an important part in the pathogenesis of neonatal or postnatal atelectasis and pneumonia post operative atelectasis and pneumonia and lobar pneumonia They consider that the deleterious qualities of the pneumonic exudate are not due solely to its viscosity but also to its content of virulent pneumococci and fibrin the coagulability of which endangers the drainage of the finer bronchioles and pulmonary parenchyma The expectorated sputum should not be taken as indicating the type of bronchial mucus occluding a lobe of the lung for it may be merely an overflow from the bronchus For example the lung parenchyma in lobar pneumonia is filled with coagulated fibrinous exudate while the expectoration is rusty and mucoid and mucous glands are not found in bronchi smaller than 1 mm in diameter Pneumococci produce an exudate which is sufficiently viscid to occlude a lobar bronchus and cause air absorption and atelectasis Lobular involvements on the contrary are usually associated with other organisms such as staphylococci streptococci and *B influenzae* In the recorded experiments it was found that the ease with which atelectasis was produced depended on the virulence as well as on the viscosity of the injected pneumococcal sputum It was shown that 1 c cm of a concentrated broth culture of a virulent strain of pneumococci was sufficient to cause pneumococcal atelectasis when sprayed into the bronchus of a dog The only distinction if any that can be made clinically between post-operative atelectasis and post-operative pneumonia is the greater toxicity of the patient for the physical and radiographical signs are similar The crisis of pneumonia may indicate that there is now a sufficient enzyme liquefaction of the intrapulmonary exudate to allow the beginning of the ingress of air into the finer bronchi and alveoli and the consequent starting of the lung to eject its liquefied matter This is advanced by the authors as a counter theory to the other explanation of some special antibody formation to which they cite such objections as the increased susceptibility sometimes conferred by one attack of pneumonia They deduce the following therapeutic recommendations In pneumococcal bronchitis the repeated inhalation of mixtures of carbon dioxide and oxygen certainly constitutes an excellent preventive and often curative treatment When chill elevation of temperature toxic general symptoms and increased dyspnoea and cyanosis which indicate bronchial obstruction are present nothing is more efficient than bronchoscopic re establishment of the patency of the bronchi a measure which gives gratifying results when instituted early Although the symptom-complex of pneumococcal bronchial obstruction is variable the authors define a syndrome of different phases The underlying or basic condition is held to be atelectasis but the clinical phenomena will depend on the size of the occluded part of the lung the duration of the bronchial occlusion the type and virulence of the infecting micro-organism the character and amount of the alveolar exudate and the complications which may arise The amount of the alveolar exudate it is added determines such diagnostic signs as the degree of shift of the heart and mediastinum and of the elevation of the mediastinum hence the less marked radiographical signs of atelectasis in lobar pneumonia although there are cases in which the radiographical signs in pneumonia are the classic signs of atelectasis especially in children

Surgery

409 Traumatic Rupture of the Liver

Many cases of traumatic splenic rupture have been reported evolving in two stages with an interval of several hours or even days between the accident and the appearance of signs of intraperitoneal haemorrhage F BERTRAND (*Bull et Mém Soc Nat de Chir* March 11th 1933 p 366) believes that this may occur in rupture of any abdominal viscus and records such a sequence in a case of hepatic rupture The patient a young male after a fall on the right hypochondrium was apparently in good health and able to resume his ordinary occupations Eight days later symptoms of intraperitoneal haemorrhage supervened At operation a rupture of the antero-superior surface of the right hepatic lobe was discovered tamponing was the sole treatment performed The patient made an uneventful recovery Two theories are advanced as to the cause of the delayed haemorrhage One suggests that favoured by the syncopal state following the injury a thick clot of blood closed the fissures and prevented immediate bleeding this gradually became detached thus permitting of the secondary haemorrhage The other theory is that a subcapsular haematoma was formed rupture of the capsule subsequently occurring with free haemorrhage into the peritoneum Bertrand advises that strict supervision for at least eight to ten days be made over all cases of abdominal contusions Three interesting points were noted in the present case absence of bradycardia presence of subicterus and slight haematemesis The latter is explained as follows slight traces of blood can through the biliary canaliculi reach the liver bile duct and duodenum causing symptoms

DINNEFORD'S

A safe and simple antacid which is also a gentle laxative, must necessarily be of great value to the Medical Profession for administration to ladies and children and all who are constitutionally delicate. Extensively prescribed and used by the Medical Profession for a century and still incomparably better and safer than powdered magnesia

PURE FLUID **MAGNESIA**

DINNEFORD'S is immensely useful in the nursery, too when mixed with infants' food it prevents many of the troubles due to acidity, flatulence, etc. As a reliable and safe solution which may be freely used for many ailments we would request your kind consideration of DINNEFORD S, as occasion offers.

of hepatic colic, it can then flow backwards into the stomach with ensuing haematemesis The prognosis of hepatic rupture is always grave statistics show a mortality of 56 to 62 5 per cent According to all authorities suturing is the treatment of choice Observations, however, show that tamponing is as effective as simple sutures with closure of the wall

410 Recovery from Mesenteric Embolism

J SMITH, jun (*Aust and New Zeal Journ Surg*, January, 1933, p 309), records in detail three cases of mesenteric embolism in which surgical intervention was followed by recovery A striking feature in each was the abrupt demarcation of the affected from the non-affected portions of the bowel and the mesentery The embolus, which consists of detached vegetations from the mitral or aortic valves or atheromatous aortic patches, usually lodges in the superior mesenteric system The result is generally an infarction of the intestine of the haemorrhagic type Sudden anaemia produced by the blockage of a branch of the artery sets up a violent spasmodic contraction of the bowel, and establishment of the collateral flow is thus often rendered impossible The salient symptoms and signs are intense colicky pain vomiting, abdominal distension, and tenderness, and, in a majority of cases, blood in the stools—almost a pathognomonic sign when present Treatment involves resection of the affected portion of the gut, but it is difficult to indicate the length which may be removed safely, since individual factors are concerned Permanent recovery has followed the excision of as much as fifteen feet of small intestine, but death from inanition has been reported in a case in which only eight feet were removed The author recalls the fact that spontaneous recovery has ensued, even though no resection was attempted This is due to the re establishment of the collateral circulation He thinks, therefore, that surgeons should not be too pessimistic, even though there is a relatively high mortality in cases of mesenteric embolism

Therapeutics

411 Treatment of Gastric Ulcer by Diathermy of the Sympathetic and Parasympathetic

Strikingly successful results are reported in a preliminary communication by R GROTH and P JEGOROW (*Münch med Woch* March 3rd, 1933, p 343) in the treatment of a variety of cases by diathermy applied in the cervical region Two electrodes, 5 by 10 cm, are placed on either side of the neck along the sterno mastoids and current strengths of about 0 5 to 1 ampere are employed The effect of these currents is in part upon the vago-sympathetic, and the improvement in the cases so treated is referred to influences exerted upon the effector organs associated with these nerves In fifty cases of gastric hyperacidity (twenty with haematemesis and blood in the stools, associated with gastric or duodenal ulcers diagnosed by x rays or operation, thirty cases with spastic pains, pylorospasm, etc) the application of the treatment for twenty to thirty sittings of about thirty minutes each was followed by remarkable improvement The gastric pain disappeared, and in most of the cases the pyrosis and regurgitations ceased, and the free acidity of the gastric contents diminished, frequently to normal Gastric syndromes with lessened acidity were unaffected by this procedure Especially noteworthy were the effects produced in cases of epilepsy, the attacks in most instances disappeared completely after a few applications of the current Diathermy of the lumbo sacral vegetative centres also led to very good results in affections of the pelvic organs the lower limbs and even in cases of myelitis In such cases the electrodes are placed one over the affected area in the lumbo-sacral region and one in the rectum Indications are further discussed by the authors for a more extended use of this method particularly in the thoracic, abdominal, and cranial regions

412 Treatment of Mumps by Lead

MARTINY (*Bull Soc de Thér* March 8th 1933 p 72) remarks that though mumps is usually a mild affection and the effects of treatment are difficult to appreciate the swelling and pain in the parotid region last on the average four or five days He had found, however, that the oral administration of minute quantities of metallic lead, triturated in lactose, and placed on the tongue every hour—except during meals and at night—aborts the disease in twenty-four hours and causes rapid disappearance of the pain and swelling The treatment has no effect on mumps orchitis, but none of the patients who had been treated by lead subsequently developed this complication The treatment is described as quite harmless

Disease in Childhood

413 Prognosis in Children with Open Pulmonary Tuberculosis

S HASLE (*Ugeskrift for Laeger* December 22nd 1932 p 1231) has investigated the fate of children suffering from open pulmonary tuberculosis and treated in a Danish sanatorium between 1911 and 1926 Of the 496 sputum positive children fifty-six could not be traced About two-thirds of all the children were girls It was found that five years after discharge 282 (64 per cent) had died Of the survivors, 121 (28 per cent) were well and thirty seven (8 per cent) were still ill About a third of all the children had died within a year of the first discovery of tubercle bacilli, their average length of life after this discovery being only seven months Five years after discharge the average duration of life of the 282 children who died was 20 2 months, as reckoned from the date of the first discovery of tubercle bacilli This average was only 18 2 months for the girls, whereas it was 27 7 for the boys Hasle points out that not only were the girl patients twice as numerous as the boys, but they also succumbed to the disease more quickly A classification of the children in three age groups (1 to 7, 7 to 12, and 12 to 16 years) showed that in the oldest group there were as many as 102 girls and thirty boys The average duration of life of the girls in this group was remarkably short—a finding which tallies with the common clinical observation that at puberty the resistance of girls to tuberculosis is very feeble The practical lesson the author draws from his statistical analysis is that, in view of the bad prognosis for children with open pulmonary tuberculosis, skilled treatment should be provided as early as possible

414 V POULSEN and A O ANDERSEN (ibid, February 9th, 1933, p 169) have investigated the life histories of 622 Pirquet-positive children suffering from pulmonary tuberculosis As many as 199 of them were sputum positive Of these 199 children under the age of 10 years seven could not be traced, forty four were found to have died, and 148 were still alive In the first year of life there were fifty-four infants in whom tubercle bacilli were found, only twenty-three of them had died In the older age groups the proportion of deaths was still lower The authors ask why their findings are so much better than those of other observers such as Hasle Their answer is that by demonstrating tubercle bacilli by such delicate tests as gastric lavage followed by culture and animal inoculations, they have included in their material a number of cases which by other methods of diagnosis would have been classed as sputum negative In about half of these 199 children there were no stethoscopic changes in the lungs, and in thirty one cases even the x ray examination of the lungs was negative In a table dealing with 148 sputum-positive children under the age of 10 and kept under observation for an average period of two years, the authors show that as many as 127, or 85 5 per cent, were apparently well Most of the deaths in this

INJURIES TO TISSUES

LONG-CONTINUED suppurations, resulting from wounds and other injuries to the tissues, may be speedily overcome by general irradiation, in addition to local treatment.

Antiphlogistine Dressing, due to its ability to prolong hyperaemia, to its plasticity, which enables it to cling to any part of the body, and to its antiseptic and osmotic qualities, which help to overcome infection, raises the resistance of the patient, so that striking results in rapid healing are often obtained by this mode of treatment.

material occurred during the first two years of life It would therefore seem that after the age of 2 years the demonstration of tubercle bacilli in the sputum of a child is far from being so fatal a sign as was formerly supposed to be the case

415 Progressive Ossifying Myositis

Progressive ossifying myositis is characterized by multiple osseous formations in the intra and peri muscular connective tissue tendons and aponeuroses and ends in impotence of the affected regions subsequent to successive attacks E APERT and P GARNIER (*Paris Méd* January 28th 1933 p 76) describe this condition after briefly reviewing the literature The Anglo Saxon is more often affected than members of the Latin races and boys than girls (in the ratio of four to one) The affection occurs in infants usually about the fifth year Older children are rarely attacked and in these the onset can generally be traced to infancy In most cases the onset is insidious the general health is not affected local signs are slight pain is absent and the tumour is only accidentally discovered usually on the back or neck In some cases there is more or less general reaction with tenderness heat and oedema of the swollen area and glandular inflammation The initial symptoms subside quickly in about ten days and occasionally the tumour completely disappears When once established the first tumour is rapidly followed at varying intervals by others in different regions after acute attacks intercurrent maladies seasonal changes and traumatism favour the appearance of these sequels The tumour forms an irregular mass with osseous prolongations The skin except in purely superficial growths is non adherent The muscles chiefly affected are those of the back neck trunk upper limbs and the masticators Those of the face eye diaphragm heart sphincters and other non striated ones are never involved The lower extremities are less often attacked and when involved the flexors are predominantly affected The tumours are asymmetrical thus causing abnormal attitudes and deformities The intelligence is unimpaired and the organs function normally for a long period Congenital malformations chiefly microdactylia other exostoses and disorders of development may also coexist The lesions primarily affect the interstitial connective tissue the muscles being secondarily involved The pathology and the still obscure pathogenesis are briefly discussed Certain modern authors consider that the condition is merely an ossification of haematomas due to haemorrhages from congenitally malformed capillaries and vessels The prognosis is always grave and the disease usually slowly progresses to a fatal termination intercurrent maladies chiefly pulmonary tuberculosis may supervene Treatment is usually of no avail though radiotherapy has given some encouraging results Surgery is indicated only in very rare cases to ameliorate or correct embarrassing attitudes or ankyloses

416 Madelung's Disease

E KUN (*Thèse de Paris* 1933 No 23) who records three illustrative cases one of which was in a boy aged 5 and two in girls aged 11 and 14 states that Madelung's disease is not a subluxation but an incurvation of the radius which gives rise to the other deformities simulating subluxation although the bones of the carpus still remain attached to the radius There is however always a dislocation or subluxation of the ulna Madelung's disease is rare and the aetiology is uncertain but the part played by late rickets appears to be of considerable importance The radiological picture is characteristic and always enables the diagnosis to be made The treatment is surgical but an operation should only be performed when the deformity is well marked otherwise there will be recurrence The most logical operation is cuneiform osteotomy of the radius sometimes associated with resection of the lower end of the ulna so as to bring it to the same level as the lower end of the radius Opotherapy should be tried when disturbance of the endocrine glands is suspected

Obstetrics and Gynaecology

417 Cervical Obliteration during Pregnancy

J KREIS (*Gynecol et Obstet* February 1933 p 97) considers and demonstrates by means of diagrams and tables the physiology and pathology of the obliteration of the cervix during pregnancy The period at which the head engages and the times and causation of the rupture of the membranes are also considered Spontaneous delivery is not necessarily a normal one in the physiological sense since there may be defective mechanism even in such cases The mechanism of the preparatory stages which occur during pregnancy (taking up of the cervix and formation of the inferior segment) are not distinguishable in principle from those of labour —dilatation of the os and further formation of the segment Anomalies of the mechanism may be found in both cases The condition of the cervix its length its partial or total permeability present sufficient varieties in primiparae and multiparae as to abolish any rigorous clinical rule Physiologically the multipara should conform to the same postulates as the primipara Any differences should be attributed to a diminution in functional and tissue qualities The same faults may be met with in primiparae although the multipara is more frequently the subject of pathological conditions The fact that the head engages in a primipara relatively early in pregnancy presupposes the early effacement of the cervix If the head remains mobile after the taking up of the cervix there must be special inhibitive forces at work Multiparae examined at the tenth month show a larger number with the head engaged than with it mobile The moment of the rupture of the membranes spontaneous premature or at complete dilatation is decided by the extent of the fixation of the inferior membranous pole to the lower uterine segment By reason of the frequent irregularity of the physiological obliteration of the cervix rupture of the membranes before complete dilatation occurs in at least half the cases Kreis considers that artificial rupture is indicated in cases showing a retardation in the taking up of the cervix That a multipara generally has an easier confinement is considered to be more the result of a pathological disorganization than a favour physiologically acquired

418 Positive Aschheim Zondek Reaction in Spurious Pregnancy

It is recognized generally that a negative Aschheim Zondek reaction is not absolute proof of the non-existence of pregnancy On the other hand a positive reaction may occur in cases of hydatid mole chorion-epithelioma or granuloma—that is in any condition causing hyperhormonic amenorrhoea with excess of lutein production K KAISER (*Zentralbl f Gynäk* February 4th 1933 p 266) reports an illustrative case A married woman aged 33 had had a normal confinement three years previously and no subsequent miscarriage Amenorrhoea and increasing obesity continued for seven months No foetal movements were felt but colostrum was present The vaginal walls were relaxed and livid and there was a slight sanguineous discharge from the closed os A tumour extended to within three inches of the umbilicus No foetal heart sounds were heard. The Aschheim Zondek reaction was strongly positive The diagnosis was that of pregnancy of six to seven months with the probability of a dead foetus although the form of the tumour suggested an extrauterine pregnancy A skiagram showed curved streaky nodular shadows suggestive of a foetal vertebral column The haemorrhage ceased after rest and the general health was good In the eighth month labour appeared imminent but the foetal heart sounds were absent The cervix was dilated with laminaria tents Since there was no pain nor haemorrhage a sound was passed into an empty uterine cavity measuring 4½ inches The tumour lay behind and to the left of the uterus Median laparotomy was performed and a very large left parovarian cyst closely adherent to the uterus was removed with difficulty The right ovary was cystic

The Treatment of ARTHRITIS

IN the report just issued by the B M A on the causation and treatment of Arthritis and allied conditions, attention is called (Section IXe) to the importance of Vitamins in the diet in Arthritic and Fibrositic disorders, and especially to the supply of Vitamin B Wheat germ is specifically recommended as a source of this Vitamin

Bemax is prepared from the finest selected germ It is freed from flour and bran (which latter may be undesirable on account of its indigestible residue) and rendered stable by a carefully adjusted process of preparation No additional ingredients are added

The Vitamin B_1 activity of Bemax is in the neighbourhood of 360 International Units per ounce and has been found to remain unimpaired even when stored over a period of years

The average daily requirement of Vitamin B_1 in normal health varies from 180 to 300 International Units and is supplied by a half to three-quarters of an ounce of Bemax

Bemax is therefore the most reliable source of Vitamin B for prolonged administration.

BEMAX

THE RICHEST NATURAL VITAMIN TONIC FOOD

2/6d size lasts an adult a month

Laboratory reports on BEMAX and a clinical sample for personal trial will be sent to any medical man on receipt of his professional card

THE BEMAX LABORATORIES, UPPER MALL LONDON W 6

MODERN DIETICIANS ACCLAIM **BRAN** AS A VALUABLE SOURCE OF **VITAMIN "B"**

It is not only because of its actual Vitamin B content — as much as 45 standard units to the ounce — that dieticians favour the addition of bran to the diet, but because this vitamin is combined in bran with *very few calories* For modern men and women who do not wish to put on weight, bran is therefore a particularly suitable source of vitality.

As a relief for constipation, bran is generally accepted as a most natural corrective. In Kellogg's ALL-BRAN the bulk is made softer and more palatable by special processes of cooking, flavouring and crumbling. Within the body it absorbs a large amount of moisture, forming a soft and easily moved mass which clears the wastes from the intestines Kellogg's ALL-BRAN furnishes "bulk" in generous quantity because it is 100% bran.

Except where the intestinal tract is highly sensitive, or the use of any form of fiber is contra-indicated by intestinal conditions, Kellogg's ALL-BRAN may be safely prescribed It is delicious as a cereal with cold milk or cream, or it may be cooked into biscuits, cakes, omelettes, etc. A full-sized packet will be sent free to any doctor requesting it.

Civilization
Has found us
Embarrassed
With thirty feet or so
Of food canal
Well adapted
For prehistoric days
Of irregular meals
With much
Useless material
In the menu
And so, *constipation*
Became a disease
Of civilization
But the same civilization
Has provided
The remedy — AGAROL
Gentle and effective
As only a good
Mineral oil
Emulsion
Can be.

It lubricates
And softens,
And also stimulates
The intestinal tract.
Palatable
Beyond complaint,
Suitable
For adult or child,
Agarol is
The modern answer
To the problem
Of constipation.

★

Will you try it
And be convinced?
Just write — and soon
A supply will be
On the way to you.

Agarol Brand Compound is the original mineral oil and agar-agar emulsion with phenolphthalein.

AGAROL for Constipation
BRAND COMPOUND
WILLIAM R. WARNER & CO LTD 300 GRAY'S INN ROAD, LONDON, W.C.1

nearest to mother's milk because

(I) On **analysis,** its constituents are virtually identical with breast milk

In Humanised TRUFOOD — which is constructed from pure cow's milk free of tubercle bacilli—the casein is in the same proportion to the lactalbumen as in breast milk. This casein forms a light flocculent precipitate in the baby's stomach whereas other Baby Foods being merely dried cow's milk are excessive in the proportion of casein and consequently tend to gastric disturbance.

The Unique Trufood Spray Process of dehydration allows the temperature of the milk to be raised only to 145 — thus preserving intact the vital chemical and physical construction of the milk.

for adults

Humanised Trufood is also recommended as an ideal diet for those suffering from gastric disorders and insomnia.

Last but not least—

USE AND RECOMMEND A safe SOAP!

That greatest authority, the Encyclopædia Britannica, says "the skin is liable to be attacked by more forms of irritation, parasitic or other, than any organ of the body," and of Coal Tar, "The pharmaceutical use of Coal Tar products takes its place in the front rank, not so much because of the amount of material used, which is comparatively small, but on account of its importance in the prevention and suppression of disease"

From replies received by the independent National Institute of Industrial Psychology to letters sent to thousands of doctors, Wright's is used more frequently by the medical profession than any other toilet soap Convincing proofs of its reliability and merit!

WRIGHT'S *coal tar* SOAP

FOR FRESHNESS AND RADIANT HEALTH

TO AN OBSTETRICIAN

who is losing faith in alkalization during the pregnant period

IF you have never tried Alka-Zane, we earnestly invite you to let us send you a trial supply In Alka-Zane you will discover a truly efficient combination of those alkaline salts that enter into the formation of the "alkali reserve" Here are sodium, potassium, calcium and magnesium in the form of carbonates, phosphates and citrates—no sodium chloride, no tartrates, no lactates, no sulphates No compromise with efficiency And you must have palatability—in Alka-Zane your patient will find an invigorating, refreshing drink She can take it with milk or fruit juices, if she prefers.

Let us send you a trial supply There is no obligation or cost.

"Azoule"
Solution
A.B.A.
(Trade Mark)
in
Pruritus Ani

Accumulating experience confirms the remarkable effect of the new local anæsthetic 'Azoule' Solution A.B.A. in Pruritus Ani and Anal Fissure (see B.M.J., Aug. 30 1930). Outstanding features of this product are its prolonged local anæsthetic effect which lasts as long as ten days and its non-toxicity.

Wherever prolonged local anæsthesia is required 'Azoule' Solution A.B.A. is the agent of choice.

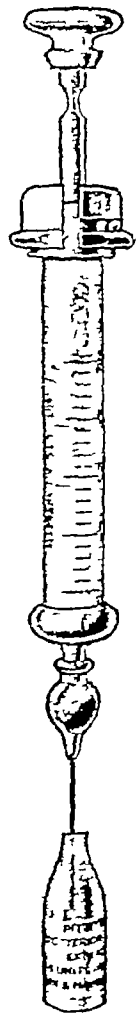
Hypodermic Medication
with
"Azoule" Solutions



"Azoule" Hypodermic products are permanent sterile solutions prepared from standardized drugs of the highest purity and are intended for subcutaneous, intramuscular, and intravenous injections.

The 'Apyrogen' Distilled Water used in the preparation of "Azoule" Solutions is rendered absolutely free from toxins by means of a special process of re-distillation.

Each dose is enclosed in a sterile hermetically sealed ampoule of Jena glass. This glass is alkali free and owing to its property of absorbing actinic light rays is specially suitable for the preservation of sterilized solutions.

A descriptive leaflet containing the latest list of "Azoule" Solutions will be sent post free on application.

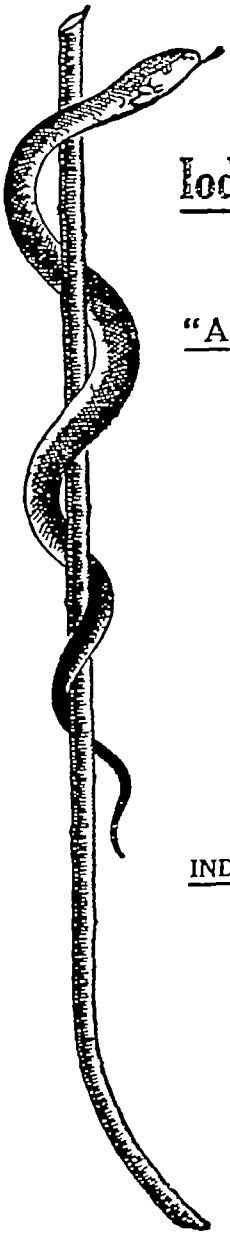
Oppenheimer Son & Co Ltd



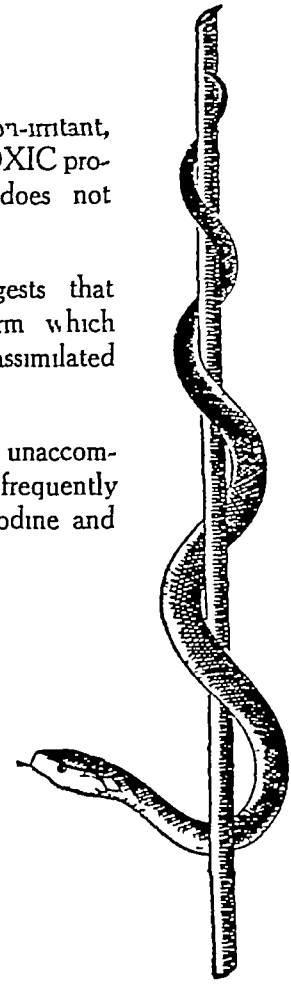
Iodine Therapy

"ALPHIDINE"

ALPHIDINE is a non-irritant, relatively NON-TOXIC product of Iodine which does not cause Iodism

Clinical experience suggests that the Iodine is in a form which is readily taken up and assimilated by the Thyroid Gland

Its administration is unaccompanied by depression so frequently caused by the ordinary Iodine and the Iodides



INDICATIONS —All those conditions arising from a subnormal Thyroid.

HYPERTENSION, ARTHRITIS, RHEUMATIC CONDITIONS generally

Also valuable in fatty infiltration.

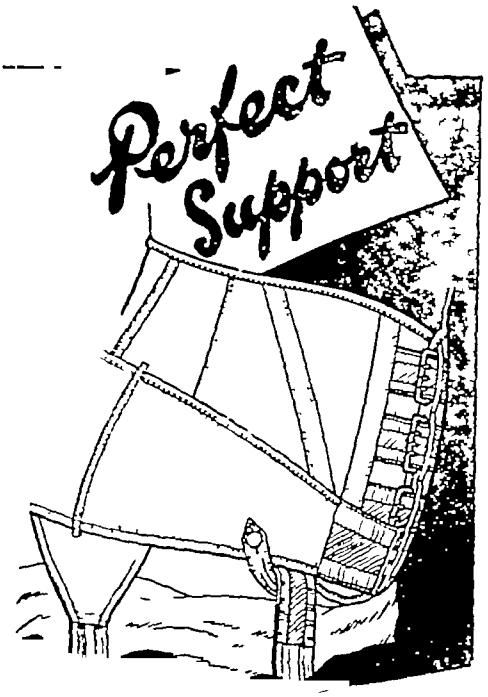
Salt and Son Ltd.



YOUR PATIENT SECURES PERFECT PELVIC SUPPORT *with*

SALT'S Sacro-iliac BELT

Sacro iliac strain whether resulting from parturition or external trauma demands firm equable and continuous pressure to the pelvic girdle in order to approximate the subluxated components of the articulation Designed in accordance with fundamental anatomical and physiological principles SALT'S SACRO-ILIAC BELT gives such support, rapidly restoring the normal relationship of the sacral and iliac bones As a result, pain and discomfort are quickly relieved So comfortable, moreover is this support that wearers are able to pursue their everyday tasks without being reminded of its presence. By reason of its complete support a beneficial effect is exerted on the tone of the abdominal viscera while spinal weakness if present, is assisted. SALT'S SACRO ILIAC BELT is also eminently suitable as a support in the after-treatment of fractures of the pelvic bones

The Weaning Period

FROM six months of age onwards, the mineral constituents of the infant's dietary assume increasing importance Not only must the necessary salts be present investigation shows that, for instance, the proper ratio between the proportions of calcium and phosphorus must be maintained

■ ■ ■ ■

"Allenburys" Malted Food No 3 is specially adapted for use after six months of age It contains the necessary amount of iron, of calcium and phosphorus in correct ratio, and of antirachitic vitamin D.

■ ■ ■ ■

"Allenburys" Malted Food has a basis of specially cooked and dextrinised wheaten flour; this is changed by the malt diastase present into a complex of dextrins and sugars which form the infant's introduction to starchy food.

■

This announcement regarding the "Allenburys" Foods is No 9 of a series which will be continued

IBIS-HEADED GOD THOTH, THE GREAT MYTHICAL PRIEST-PHYSICIAN, WHOSE INFLUENCE PERVADED ANCIENT EGYPTIAN MEDICINE.—Thoth (or Tahuti) plays an essential part in religio-medical history for not only did he, in Egyptian belief invent medicine but without him there would have been no magic. Thoth as Lord of Divine words, ' was Pā s magician and the supreme magician of Egypt The words referred to are the words of power" whatever was commanded in these magic words came to pass Thoth alone knew them originally and he only could teach them to the priest physicians, who were not qualified healers until they had been revealed to them It was these words, pronounced over them that imparted power to the remedies taken and to the unguents and bandages applied Thoth is often represented with a pen and writing palette, as here depicted, for he was the inventor of writing and acted as scribe of the gods

Date From earliest times The illustration is c. 1580 B.C.

COPYRIGHT

The great psychologist,
William James,
Sized man up rightly
As a creature of habit.
His habits once formed,
Man holds on to them
Tenaciously
Any attempt at change meets
With great resistance
Regular bowel movement
Is also the result
Of the formation
Of regular habits
This is possible
When AGAROL
Is employed
In *constipation.*
For Agarol,
The original emulsion
Of mineral oil and agar-agar
With phenolphthalein,
Not only softens
The intestinal contents,
But also gently
Stimulates
The peristaltic function
This makes evacuation
Not only easy
But also certain
When a dose,
A tablespoonful,
Is taken
At bedtime
Soon after breakfast
Next morning
Evacuation
Takes place
Repeated daily
This soon will grow
Into constant habit
Regularity
Makes for habit;
And habit
For regularity
And Agarol
Promotes both.

✣

Will you try it
And be convinced?
Just write—and soon
A supply will be
On the way to you.

Agarol Brand Compound is the original mineral oil and agar-agar emulsion with phenolphthalein Palatable, easily mixed with other liquids, Agarol is suitable for every age period.

Remarks
ON
ANAEMIA IN GENERAL PRACTICE *
BY
L J WITTS M D F R C P
ASSISTANT PHYSICIAN GUY'S HOSPITAL WILL EDMONDS CLINICAL RESEARCH FELLOW

About half the patients who are sent to me for anaemia have a normal blood count They are not suffering from anaemia but from debility very often psychological in origin An unhappy love affair does not require treatment with liver extract but I have seen it prescribed in more than one such case on a mistaken interpretation of the symptoms as anaemia On the other hand anaemia is often overlooked especially when it is complicated by the sallow complexion of the chronic abdominal invalid or the parchment skin of old age If we remember that anaemia is likely to be present in long standing cases of dyspepsia and that pernicious anaemia is a disease of old age we shall be forearmed and make fewer such mistakes It is often difficult to be certain of the presence of anaemia from clinical inspection The white face of the sedentary worker usually hides a normal blood while the invalid who has been lying in the sunshine in the garden may have a sunburnt complexion along with a haemoglobin of 40 per cent and anginal pain on exertion The lips are not a much better guide than the skin The conjunctivae and the palate best reflect the state of the blood

Anaemia is one of the few diagnoses about which we can be absolutely certain It is decided at once by the estimation of the haemoglobin and I should like to lay down as my first axiom that *treatment should not be given for anaemia until the diagnosis has been confirmed by the haemoglobinometer* Haemoglobinometry is a controversial subject and the large number of apparatus which are on the market suggests that none is absolutely satisfactory The Haldane apparatus is probably the most accurate for routine use but it is a little too complicated for general practice and not very handy at the bedside The preliminary estimation of the haemoglobin can be rapidly and simply performed by the Tallqvist test in which a drop of freshly drawn blood is taken on a slip of blotting paper and compared with a coloured scale This test is quite as accurate as that made by many an expensive apparatus and it far more sensitive than the unaided eye

My second axiom is that *symptoms of anaemia rarely appear until the haemoglobin has fallen below 75 per cent* There are certain exceptions to this axiom more especially in pernicious anaemia where glossitis and nervous changes may appear with a haemoglobin percentage little below the normal It is nevertheless a good general rule and if a patient has a haemoglobin of 75 per cent or over it is unlikely that weakness or dyspnoea is the result of anaemia On the other hand if the haemoglobin is below 75 per cent the patient is truly suffering from anaemia and the next step is to decide the exact nature of the anaemia It is a short sighted policy to begin treatment without further investigation It is true that the anaemia may sometimes be relieved by a grape shot prescription of iron liver arsenic and hydrochloric acid but in the absence of an accurate diagnosis it is impossible to foresee the future course of the illness or foretell the danger of relapses or complications Moreover the anaemia may be a symptom of some underlying malady which progresses unfavourably while time is lost during symptomatic treatment

My third axiom therefore is that *if the haemoglobin is below 75 per cent a complete blood count should be performed* An accurate blood count may at once elucidate the diagnosis showing perhaps leukaemia or frank pernicious anaemia More commonly a banal anaemia of low colour index is found and the diagnosis must be established by further clinical investigation Anaemias may be roughly divided into

1 Those which are essentially diseases of the blood-forming organs and

2 Those which are secondary to some other disease

AETIOLOGY OF ANAEMIAS

It is wise to remember that symptomatic anaemias are far more common than primary diseases of the blood-forming organs and that they rarely respond to symptomatic treatment until the underlying disease has been corrected The causes of symptomatic anaemia may be roughly classified as haemorrhage infection toxaemia and new growth Common causes of haemorrhagic anaemia are peptic ulcer haemorrhoids and menorrhagia When infection produces anaemia the infection is usually obvious and dominates the clinical picture as in the anaemia associated with rheumatic heart disease with subacute bacterial endocarditis or with typhoid fever Anaemia is often attributed to focal sepsis or to syphilis but I have rarely seen anaemia much improved by the eradication of foci of sepsis or the treatment of a positive Wassermann reaction and such findings are more often coincidences than aetiological factors In respect to toxaemia I would emphasize the importance of chronic nephritis as a cause of anaemia and I deprecate the attribution of anaemia to intestinal toxaemia I have seen more than one patient who had been treated for months with bowel antiseptics colon lavage and vaccines of faecal organisms without any benefit and who improved rapidly on the prescription of iron Malignant disease should be considered in every case of obscure anaemia Anaemia occurs more especially in malignant disease of the stomach and of the large bowel in which it may be the presenting symptom Such anaemia frequently responds well to iron [4] or to liver [5] the haemoglobin rising rapidly under treatment but the growth progresses unchecked Anaemia may be present in growths outside the *gastro-intestinal tract as in one of* my patients who presented an obscure anaemia with a haemoglobin of only 24 per cent and who ultimately proved to have carcinoma of the lung with widespread metastases It is however rarely so severe as in gastro-intestinal carcinoma

It is clear that the diagnosis of a case of anaemia requires a detailed history a complete investigation and a careful weighing of the data obtained Particular attention should be devoted to the gastro-intestinal tract Of special investigations one of the simplest and most informative is the examination of the stools for occult blood I should never be content to treat a patient for anaemia when there was unexplained occult blood in the stools But important as it is to exclude gross organic disease in the diagnosis of a case of anaemia it is equally important not to attribute anaemia to trivial and unreasonable causes The red blood cells and the marrow cells from which they arise constitute an organ larger than the liver This organ is not only bulky but robust as is shown by the sheep used in our bacteriological laboratories which give 100 c cm of blood a week for years on end without developing anaemia or by human transfusion donors who have given a litre of blood at short intervals

* A post graduate lecture to the Leicester Medical Society May 10th 1933

RUTHIN CASTLE, NORTH WALES

REDUCTION OF FEES

In view of the present economic position the inclusive fees at Ruthin Castle formerly from 17 guineas a week have been reduced to from 15 guineas a week.

The fees include medical attendance all scientific investigations that may be needed such as analyses bacteriological cultures the ordinary x ray examinations and electrocardiograph readings all treatment that may be prescribed such as special diets insulin artificial sunlight electrical treatment baths massage nursing medicines or vaccines board and lodging.

The only extra charge is that for a complete alimentary x ray examination or for x ray therapy.

All the usual forms of treatment are given at Ruthin Castle. The climate is mild. The annual rainfall is 30·5 inches that is less than the average for England. There is central heating throughout. Should the accommodation in the Castle not prove sufficient comfortable rooms can be obtained near by for those undergoing treatment.

Address—THE SECRETARY Ruthin Castle North Wales. Telegrams CASTLE, RUTHIN. Telephone RUTHIN 66.

The above House which was established in 1826 is an Institution for the care and treatment of persons suffering from mental diseases and nervous disorders. Certified voluntary and temporary patients are received. Separate houses for treatment and accommodation of special cases adjoin the Institution. There is a seaside branch Kearsney Court near Dover to which patients may be sent for treatment or on holiday. Motor and carriage exercise is provided as required. Patients can avail themselves of a course of physical drill. Tennis Courts. Entertainments dances and indoor amusements held throughout the year. Terms from £3 3s. per week.

Illustrated prospectus and further particulars can be obtained from the Medical Superintendent.

without any serious fall in haemoglobin When, therefore, severe anaemia develops in a patient who has only a moderate dental sepsis, or slight haemorrhoidal bleeding, or a normal pregnancy, it is much more likely that there is some underlying disorder of the blood than that the anaemia is due to such small causes

CLASSIFICATION

I am accustomed to classify the primary or essential diseases of the blood into four main groups I will dismiss the first three groups rather shortly, so that we may concentrate on the important fourth group, the treatment of which is so largely in the hands of the general practitioner

1 *Leukaemia and Hodgkin's Disease*—These diseases are characterized by changes in the white cells of the blood or enlargement of lymph glands They are probably closely allied to the malignant growths, and are as invariably fatal Treatment with x rays or with arsenic produces great symptomatic improvement, though life is probably but little prolonged

2 *The Hepato-lienal Diseases*—These are diseases of the blood in which the liver and spleen are also involved Here I include acholuric familial jaundice and splenic anaemia Treatment with liver and iron may produce transient improvement, but the only satisfactory treatment is splenectomy

3 *The Haemorrhagic Diseases*—This is an ill-defined assortment of diseases, some of which are of constitutional origin Apart from the group of cases with reduction in the number of blood platelets which is benefited by splenectomy, treatment is empirical and unsatisfactory

4 *The Anhaemopoietic Anaemias*—This is the important group to which I wish to devote the remainder of this lecture I am sorry that my classification compels me to use a rather unfamiliar title but these anaemias can for practical purposes be regarded as conditions in which the nutrition of the bone marrow is impaired, and its ability to form blood cells correspondingly reduced This malnutrition may be the result of defects in the diet, or in the digestion, or in the internal organism, more especially the endocrine glands There are many conditions which give rise to anaemia in this way, but the two most important are (1) iron deficiency, or idiopathic microcytic anaemia, (2) pernicious anaemia

There is reason to believe that some cases of aplastic anaemia come under this same heading, but aplastic anaemia is so rare that we need not discuss it now Deficient supply of iron to the bone marrow results in a shortage of haemoglobin, and the anaemia which follows is characterized by the small size of the red cells and by their deficient complement of haemoglobin and consequent pallor The anaemia is therefore described as microcytic and hypochromic and it is of low colour index This anaemia may occur when the iron and haemoglobin stores of the body are depleted by long-continued bleeding as in haemorrhoids or in hookworm disease The most typical examples, however, are found in infants, and in women of reproductive age Chlorosis was probably a disease of the same type, but chlorosis has disappeared, and need not be considered to day

NUTRITIONAL ANAEMIA OF INFANCY

The investigations of Helen Mackay[4] have shown that 40 per cent of breast-fed babies and 70 per cent of artificially fed babies in the hospital class are anaemic Anaemia is perhaps less frequent in the wealthier classes The anaemia, which is of low colour index, appears about the third month reaches a maximum about the ninth month, and improves spontaneously on weaning It is not a vitamin deficiency as it develops on a high-vitamin diet and is cured by iron alone It is most severe in premature and small babies, which come into the world with a poor store of iron It is almost certainly an iron deficiency, due to the low iron content of the milk, and it is more severe in artificially fed babies, because cow's milk contains less available iron than the mother's Anaemia which is so general might have been regarded as physiological had not Helen Mackay shown that it leads to an increased susceptibility to infection Colds otorrhoea, bronchitis, and enteritis are twice as common in untreated babies as in those in which the anaemia is treated with iron Iron should always be prescribed for small and premature babies, and there are few babies, breast-fed or artificially fed, who will not benefit from it It is given as iron and ammonium citrate, 4½ to 9 grains a day A simple prescription is 1½ grains of iron and ammonium citrate in 1 drachm of chloroform water added to the feeds three times a day Administration must be commenced very slowly, starting with only 2 or 3 drops of the mixture to a feed, and taking a week or ten days before the full dose is given With this precaution it is unusual for the digestion to be upset The mother should be warned that the stools will be black Proprietary milks containing iron are now on the market They are quite effective, but some little time should be taken in incorporating them in the diet to avoid dyspepsia If a milk and cereal diet is prolonged after infancy so also is the anaemia I am a firm believer in the importance of weaning babies early and including eggs, meat, and green vegetables in the diet by the end of the first year Many of the schemes of diet which are in use to-day and which are so strongly advocated in the health pages of the popular papers, underestimate the child's digestive powers, entail extra work and expense for the mother, and produce a flabby, anaemic baby I have already mentioned that anaemia predisposes to infection Such infection greatly aggravates the anaemia, which may be rapidly fatal unless a transfusion is performed

ANAEMIA OF WOMEN

Just when we were congratulating ourselves that chlorosis had disappeared, we discovered that a rather different form of anaemia is very prevalent in women This anaemia differs from chlorosis in having its highest incidence in the late thirties, and in being profoundly aggravated by pregnancy Davidson and co-workers[5] have shown that anaemia of this type with a haemoglobin below 70 per cent is present in approximately 14 per cent of women of the poorer classes in Aberdeen It occurs also in the better classes, though with less frequency The causes are

1 The female reproductive cycle, with the loss of iron in menstruation and pregnancy
2 A diet poor in iron
3 Defective digestion of iron, 80 per cent of cases having achlorhydria or extreme hypochlorhydria

The sexual factor is paramount, while the importance of the dietetic and the digestive factors varies in different cases Associated symptoms are glossitis brittle or depressed finger-nails and splenomegaly, in some cases the resemblance to pernicious anaemia is very striking There is a great tendency to relapse, more especially during pregnancy, or at the menopause, when the menses become excessive I have already commented on the feeding of infants, and I should like to make similar remarks on the feeding of pregnant women The mother has to supply enough iron to her baby to last until it is weaned at approximately 20 lb in weight She also loses blood at the confinement If her diet is insufficient she develops anaemia and becomes more liable to puerperal infection while her baby comes into the world with a poor store

The MUNDESLEY SANATORIUM

of iron and develops nutritional anaemia. Anaemia is far more frequent than chronic nephritis or eclampsia and the diet of the ordinary pregnant woman should be designed with this point in view. She should have red meat once a day and abundance of green vegetables and fruit. In menorrhagia near the climacteric severe anaemia will usually bias us in favour of an artificial menopause by *x* rays, radium or operation when we should have otherwise waited for the natural termination of the menses.

The anaemia of women is of low colour index and the specific treatment is iron. Liver is of no value. Iron must be given in large doses and preferably as a scale preparation or as one of the ferrous salts. Minimum doses are: iron and ammonium citrate 60 grains a day, and Blaud's pill 45 grains a day. Iron should always be given by mouth as effective doses cannot be given by injection. Treatment in many cases will require to be continued till after the menopause when the anaemia has been repaired a generous diet and a maintenance dose of 10 grains of Blaud's pill will usually be sufficient. Relapses must always be expected during pregnancy and treated early or the patient may become gravely ill. Once you are on the look-out for this anaemia of women you will be surprised at its frequency. Both you and your patients will be impressed with the dramatic improvement in cases which you had formerly regarded as chronic abdominal invalidism or neurosis. But *you will only get satisfactory results by giving iron in large doses by mouth.*

PERNICIOUS ANAEMIA

In pernicious anaemia the malnutrition of the bone marrow is the result of achylia and defective gastric digestion. In the absence of the proteolytic ferments from the stomach material which is essential for the normal function of the bone marrow and the spinal cord is not extracted from the food and anaemia and degeneration of the spinal cord develop. The anaemia can be repaired by the use of liver or desiccated stomach—a substitution therapy. Pernicious anaemia can usually be diagnosed by the blood picture: the cells are larger than normal, the colour index is high and there is excess of bile pigment in the serum. Owing to the insidious onset the diagnosis is sometimes missed, the symptoms being attributed to the weakness of old age, debility after an influenzal attack, the change of life, carcinoma of the stomach or a disordered liver.

I shall omit any clinical description of pernicious anaemia and devote myself to its treatment. The results are still unsatisfactory and in far too many cases the story is as follows. A patient is found to be suffering from pernicious anaemia and he makes a good response to treatment with liver or allied substances. He is then told to eat 1½ lb. of liver a day and is lost sight of. Feeling himself better he relaxes his treatment, perhaps taking liver only once or twice a week. As a result he develops subacute combined degeneration of the spinal cord and a general and quite unwarranted belief is fostered that treatment of pernicious anaemia is of little value in preventing the onset of spinal symptoms. The real conclusions from this history are: (1) that cases of pernicious anaemia should be kept under regular supervision to see that their haemoglobin is maintained above 90 per cent.; (2) that some less onerous treatment than 1½ lb. of whole liver a day should be prescribed. Just as every patient with diabetes mellitus is under the threat of diabetic coma so every patient with pernicious anaemia is under the threat of subacute combined degeneration. Treatment of pernicious anaemia is easier than that of diabetes mellitus inasmuch as it is impossible to give an overdose of effective substance. *The golden rule of treatment is to give enough effective substance to keep the blood count normal and to increase the dose if any signs of spinal degeneration appear.* Alternatives to whole liver, adequate doses of which are intolerable to many patients, are extracts of liver, oral or intramuscular, and desiccated stomach. Liver extracts are too expensive for general use, but desiccated stomach is as cheap as or cheaper than whole liver.[1] In the vast majority of cases of pernicious anaemia the anaemia is repaired and nerve changes are arrested by a daily dose of one ounce of desiccated stomach. Most of my patients take it in soda-water, half an ounce twice a day, and eat an ordinary diet with appetite and good digestion. They do not take liver regularly and then only as an article of diet. They are warned that they must continue this treatment for the rest of their lives and they are examined at monthly or bi-monthly intervals. My own observations are in complete agreement with the much larger experience of Wilkinson that in patients treated in this way the blood remains perfectly normal, no nerve degeneration occurs and any spinal symptoms present are usually alleviated.

When a patient is seen in relapse it is wise to accelerate recovery by injecting intramuscular extracts of liver. Patients with subacute combined degeneration should also be given intramuscular extracts of liver until the blood is normal, in addition to treatment by mouth to arrest the progress of the disease. For maintenance treatment I rely on desiccated stomach but advise the patient to take as much marmite and bemax as possible. In isolated cases iron and thyroid gland may be indicated. I am not convinced of the value of massive doses of iron in subacute combined degeneration as I have seen subacute combined degeneration develop in a woman who was having massive doses of iron for a microcytic anaemia. Nor do I often prescribe hydrochloric acid in pernicious anaemia as desiccated stomach overcomes any tendency to dyspepsia and it is desirable that treatment should be as simple as possible.

Subacute Combined Degeneration

While it should always be possible to prevent the development of subacute combined degeneration it is more difficult to treat the established disease. Nevertheless it is surprising how much improvement is sometimes made. The victims of subacute combined degeneration are usually elderly people who regard paralytic symptoms as omens of an impending dissolution which they are powerless to avert. They take to their beds and give up hope of ever walking again. This attitude is often encouraged by over-solicitous relatives and it must be vigorously opposed. Every effort should be made to get the patient up on a couch or a wheel chair and to encourage him by massage and re-education to stand and walk. I have been much more vigorous in my treatment of subacute combined degeneration since I had the following experience.

Mrs. C. L. R., aged 40, came to see me supported by two sticks and a devoted husband. She had been anaemic all her life, had had sprue in China at the age of 34 and pernicious anaemia in Jerusalem at age 39. From this last attack she had recovered as regards her blood but had much weakness of her legs which she attributed to a fall and a sprained ankle. In actual fact she had subacute combined degeneration with spastic paresis of both legs and a bilateral extensor plantar response. She was not pleased with my diagnosis and on some excuse did not pay a fee then—or later. A chiropractor agreed with her own diagnosis of a sprain and manipulated her, telling her he had replaced an artery which had been twisted. She promptly gave up her sticks and boarded a ship back to Jerusalem without assistance.

PROVIDES HIGHLY SUCCESSFUL ORAL AND POSTAL COACHING FOR ALL MEDICAL EXAMINATIONS.

Special Preparations for all Surgical Qualifications

F R C S ENGLAND (Primary & Final.) **M C CANTAB M S LONDON F R C S EDINBURGH**

And all other Surgical Degrees and Diplomas.

¶ The remarkable success of Students of the Medical Correspondence College at the higher Surgical Examinations is specially noteworthy
¶ Both at the Primary and Final F R C S England the majority of our Students are successful at the first attempt and Candidates who have failed at these Examinations on several previous occasions get through without difficulty after going through our courses
¶ The Surgical Tutors of the College all hold either the M S Lond or F R C S England or both and are highly experienced teachers
¶ The Postal Courses are thoroughly clear concise and up to date and the test questions are carefully selected from those set at previous Examinations so as to embrace all parts of the subject By working systematically through the Course the Student is brought up to the examination standard in the minimum time and much unnecessary reading is saved

20 York Place Edinburgh

When a patient has organic disease we are too apt to take symptoms at their face value and to accept a degree of disability which is out of proportion to the anatomical damage Hurst has emphasized this point in his lecture on " The Hysterical Element in Organic Disease,' [3] and elsewhere, and we can hardly be too often reminded about it In subacute combined degeneration the nerve lesions can be arrested by adequate dosage of effective substance, except in the terminal stage of bladder infection and transverse myelitis It is doubtful whether the lesions are entirely spinal in situation or irreparable in nature , some of the sensory change is probably due to degeneration of peripheral nerves, which can recover completely But quite apart from the possibility of the regeneration of damaged nerve tissue, there is no doubt about the gain in bodily vigour under adequate treatment of the anaemia, and the ability of many of these crippled patients to regain the use of their hands and feet if they are properly encouraged and carefully re-educated

Mr M aged 60 developed symptoms of subacute combined degeneration in September 1929, though he had been failing in health for some time before He was rather remiss about attending his doctor and took only the equivalent of 1/4 lb of liver a day in liver extract During 1930 and 1931 the red cells remained between 3½ and 4 millions, and the haemoglobin about 80 per cent The nervous symptoms were unchanged, and paraesthesia was always present In the summer of 1932 he suddenly lost the use of his legs The blood count was now red cells 3 630 000 white cells 7 000, haemoglobin 80 per cent He was confined to his bed for about four months Joint sense was practically absent in the toes the tendon reflexes were depressed and both plantar reflexes were extensor He had much flatulent dyspepsia, and developed a venous thrombosis in the left leg Suspicion of a carcinoma was aroused and the patient himself took so gloomy a view of his future that he gave away his valuable car to a friend He was taken into hospital and treated with intramuscular injections of liver and desiccated stomach by mouth His blood count improved to red cells 4 880 000 white cells 7 800 haemoglobin 96 per cent colour index 1 With massage and re education he learnt to walk with two sticks He continued the desiccated stomach on discharge and six months later the blood count was practically identical Joint sense was still grossly impaired and Romberg s sign positive the tendon reflexes were exaggerated, and the plantar reflexes were both extensor Nevertheless he was able to work in the garden without a stick and had bought a new car in which he had recently driven over 100 miles in one day His handwriting which had previously been almost illegible on account of the numbness of the hands had also much improved

It would be easy for me to multiply instances of this kind for unfortunately about half the cases of pernicious anaemia I see are patients who have relapsed from inadequate treatment and developed subacute combined degeneration And while I have seen several paralysed patients improve so much as to be able to return to normal life, others have been too far advanced to respond, the bladder has been involved, and necropsy has revealed cystitis and ascending nephritis It is lamentable that in so many cases to-day the life of a patient with pernicious anaemia is merely extended long enough for him to develop subacute combined degeneration There is no more reason for patients with pernicious anaemia to succumb to subacute combined degeneration than for diabetics to die in coma Both complications are preventable by careful treatment

I would repeat that the treatment of pernicious anaemia is easier and cheaper than that of diabetes mellitus It is impossible to give an overdose of effective substance, and the treatment need in no way interfere with the enjoyment of a normal diet and an active life There is no excuse for relaxation of treatment and every patient should be frankly told the danger of such a course Occasional estimations of the haemoglobin should be as much a routine as tests of the urine and blood in diabetes mellitus We have had ten years to learn the modern treatment of pernicious anaemia, and it is time we took its lessons to heart

THE HEALTH OF ANTIMONY OXIDE WORKERS

BY

SIR THOMAS OLIVER, M D , F R C P

NEWCASTLE UPON TYNE

The smelting of antimony ores, and the production of antimony metal, has been practised in England for at least two centuries, but the commercial production of pure grades of antimony oxide for pigmentary and similar purposes has been in operation only since the war Antimony trioxide (Sb_2O_3) is now manufactured in large quantities, and this material, which is in the form of an extremely finely divided white powder, is much used

The smelting of antimony ores has never been regarded as a dangerous occupation, and the only malady from which antimony smelters suffer (and then only occasionally) is an irritation of the skin, which results in blotches or minute pustules—sometimes extremely unpleasant owing to itchiness The parts of the body most affected are the front and back of the forearms, the front of the chest, and the epigastrium The irritation appears to be caused when dust falls on a skin damp with perspiration, but it is noteworthy that many workers are not affected, and that in this connexion personal cleanliness is an important factor It is found that the irritation invariably disappears completely in the course of a few days if the worker ceases to have contact with antimony dust In view of the increasing use of antimony oxide in industry, it was felt desirable in the interest of the worker to ascertain whether or not the handling of this material demands special hygienic precaution Feeling that the conditions of exposure of workers engaged in the manufacture of the material are likely to be more severe than those involved in its use, I made an inquiry into the health of some workers who had been engaged in its manufacture for a period of thirteen years—which period covers the production of this material on a commercial scale in England Shortly after its manufacture was commenced the question was raised as to the possible toxic character of antimony trioxide, and at that time medical opinion could only be based on experience of the processes of antimony smelting, in which the production of antimony fumes, oxide, etc , is inevitable The view then expressed was that there was no evidence to indicate that there were any dangers in the production or use of antimony trioxide , indeed, evidence to the contrary was available The late Sir Thomas Legge, in evidence before the Home Office Departmental Committee on Paints stated that antimony oxide was only a mild irritant and could not be described as a poison at all

THE SURVEY

The following recent investigation, which affords confirmation of earlier medical opinion has been made possible through the courtesy of the Cookson Lead

EDINBURGH POST-GRADUATE COURSES IN MEDICINE

IN CONNECTION WITH THE UNIVERSITY AND ROYAL COLLEGES 1933

The POST-GRADUATE COURSES to be held this year comprise

(1) A GENERAL PRACTITIONERS COURSE from August 14th to September 9th

(2) A GENERAL SURGICAL COURSE from August 14th to September 9th

The composite fee for each Course will be £10 10s. for the four weeks or £6 6s for either the first or second fortnight.

(3) A COURSE IN OBSTETRICS AND GYNAECOLOGY AND CHILD LIFE AND HEALTH from July 17th to Aug 12th Fee £10 10s. (Minimum number 12)

In addition to the above the following *Special Courses* have been arranged SUMMER TERM.

SURGICAL PATHOLOGY—May 9th. Fee £4 4s. | OPHTHALMOSCOPY—May 1st Fee £5 5s. Minimum number 5.

SUMMER AUTUMN AND SPRING TERMS.

CLINICAL SURGERY (including Radiology)—Royal Infirmary Fee £4 4s

CLINICAL MEDICINE—Royal Infirmary (May and October). Fee £5 5s.

CHILD LIFE AND HEALTH (May and October)—6 Clinical Demonstrations Fee £1 1s.

DISEASES OF EAR NOSE, AND THROAT—Royal Infirmary Minimum number 5. Fee £10 10s

VENEREAL DISEASES—Royal Infirmary Minimum number 5 Fee £10 10

DISEASES OF EAR NOSE, AND THROAT—Ear and Throat Dispensary, Cambridge Street. Fee £4 4s

DISORDERS OF SPEECH AND VOICE (Summer and Autumn only)—Minimum number 8 Fee £3 3s.

UROLOGICAL SURGERY AND TREATMENT OF FRACTURES (Spring Term)—Fee £3 3s.

NEUROLOGICAL SURGERY (March) Fee £2 2s.

ORTHOPAEDIC SURGERY (Summer and Autumn) Fee £4 4

DURING THE PERIOD OF THE GENERAL COURSES. (AUGUST SEPTEMBER).

UROLOGICAL SURGERY AND TREATMENT OF FRACTURES—Fee £3 3s.

DISEASES OF THE BLOOD—Fee £3 3 | MODERN DIAGNOSTIC METHODS—Minimum number 6. Fee £4 4s.

X RAY PHYSICS AND ELECTRO TECHNICS—Fee £3 3 | OPHTHALMOSCOPY—Minimum number 5. Fee £5 5s.

ULTRA VIOLET RADIATIONS AND THEIR USES—Fee £3 3s | GENETICS IN RELATION TO MEDICINE.—Fee £3 3s.

NEUROLOGICAL SURGERY (September) Fee £2 2s

Further particulars may be had on application to the Hon Secretary Post-Graduate Courses in Medicine, University New Buildings Edinburgh.

and Antimony Co Ltd of Newcastle Antimony tri oxide is produced on an extensive scale at the Willington-on Tyne works of this company and opportunities were given to me for a full and complete investigation of the processes and examination of the workers It was of interest at the outset to note that no special hygienic precautions are taken—nor do they appear to be necessary—and that although overalls and respirators are provided for the use of men when engaged in packing the final product the regular use of the respirators is difficult to enforce as is the case in other trades It is also interesting to record that in the process of manufacture—particularly in the packing department where the workers are exposed to considerable quantities of antimony oxide dust—there have been very few cases of skin irritation This may be due to the fact that the men are not exposed to high temperatures and therefore perspiration is not abnormal

The total number of men directly engaged in this process was six and their service with the company was as follows

Subject	Age	Total Service	Service in Antimony Oxide Manufacture
I	61	38 years	13 years
II	48	30 years	13 years
III	63	41 years	3 years
IV	43	18 years	13 years
V	47	28 years	13 years
VI	46	20 years	2 years

Subjects I II IV and V had all worked for many years as antimony smelters before the manufacture of antimony oxide was commenced Examination gave the following results

The weights of the men ran from 8 st 10 lb to 11 st 4 lb and this was the only man of the six who weighed more than 9 st 10 lb Three of the men were under 5 ft 3 in in height They were fit felt well were swarthy in appearance and had thin walled chests and somewhat poorly developed upper arms with a scarcity of subcutaneous fat In none was there evidence of heart enlargement or of cardiac trouble Their health had been good little time had been lost through illness appetite was normal and there was no constipation kidney or bladder trouble They were married the wives were living and the mortality rate of their children had been similar to that of the average of children of workers engaged in other industrial occupations As already mentioned little time had been lost through illness Subject I with thirty-eight years service had had no real illness except mild influenza debility and slight skin inflammation while Subject II with thirty years service had had no illness beyond occasional irritable spots on the skin Subject III with forty one years service had been ill only twice the cause being rheumatism and dry pleurisy Subject IV with eighteen years service had been ill only twice through influenza Subject V with twenty eight years service had had influenza once while Subject VI with twenty years service had been ill only twice from *neuralgia and influenza*

Nothing unusual was found on microscopical blood examination The red corpuscles were healthy though the blood of one man showed slight anisocytosis Although two of the men had previously worked as lead smelters for twenty-seven and three years respectively before taking up work in antimony no basophile corpuscles were found in the blood of either of them The white corpuscles were average—that is 50 to 70 per cent polymorphs 6 per cent small lymphocytes and 8 per cent large lymphocytes Eosinophils were as high as 4 per cent Chemical examination of the urine of each workman failed to reveal the presence of antimony—an observation of considerable importance in view of the fact as is shown later that the men were excreting considerable quantities of antimony in their faeces

It is thus clear that in normal circumstances antimony oxide is not appreciably absorbed by the system owing to its relative insolubility in the alkaline and acid juices of the body The following figures which show the results obtained in the determination of antimony in the faeces of the men examined prove definite intake of antimony into the alimentary canal with subsequent elimination by the faeces

Subject	Weight of Faeces in Grams	Solids Per Cent	Dry Weight in Grams	Parts of Sb per Million in Dry Faeces	Grams of Sb in Faeces
I	30.9	22.1	6.8	1,500	0.0105
II	99.7	28.0	27.9	3,510	0.0978
III	109.5	25.8	28.3	2,040	0.0599
IV	31.4	29.4	9.2	1,290	0.0119
V	80.3	27.3	21.9	3,210	0.0703
VI	70.6	28.2	19.9	1,740	0.0346

These figures show a marked daily elimination of antimony in the excreta of the men at a period when they were most casual in the wearing of respirators and in the observance of general hygienic precautions A trial period of close hygienic supervision was then enforced and the faeces of three of the men—Subjects II III and V—were examined. The following facts when compared with the previous figures are of interest as indicating the effect of the control

Subject	Parts of Sb per Million in Dry Faeces		Milligrams of Sb in Faeces	
	N.S	S	N.S	S
II	3,510	533 1,970	97.8	5.1–20.7
III	2,040	1,330–1,640	59.9	12.7–15.2
V	3,210	603–864	70.3	8.3 10.8

N.S — "No supervision" period.
S — Supervision period," representing three samples from each worker

The blood pressure of practically all the men was below the average for their ages—a circumstance unusual among men engaged in heavy work The figures are as under

Age	Total Service	Blood Pressure
61	38	162 84
48	30	138 70
63	41	132 78
43	18	122 78
47	28	144 90
46	20	122 80

As compared with the blood pressures of men engaged in other labouring occupations these figures must be considered as extremely safe and satisfactory from the prospective health point of view

SUMMARY

The investigation has shown that the men look as if they were a year or two older than the ages stated They are swarthy in appearance and have thin chest walls but are free from respiratory disease The heart and kidneys are healthy and except for a very small patch of irritation in two of the men the skin was quite normal Blood pressure is lower than in most men engaged in similar manual work The upper arms are thin and ill developed but the grasp of the hand is good The men enjoy good health and lose little time through illness In view of these observations it is clear that the occupation of these men although it involves exposure to antimony oxide is healthy It presents no industrial hygienic problem or risk and a similar conclusion might justly be extended to workers who in other industries handle this material

BY

SIR LEONARD HILL, M B , F R S

While they enjoy a bright open fire some people dislike dull red gas or electric fires, stoves, and hot-water pipes, and usually suppose that such sources are unpleasant because they dry the air, or give off fumes they are supported in this opinion by the relief felt on opening a window These people also feel uncomfortable in a crowded room, and put their discomfort down to pollution of the air by respiration Scientific investigation has, however, proved that in such crowded rooms there is no physiologically significant alteration of chemical purity, and that the cooling power of the air is really the important factor Yaglou[1] and his co workers have shown that ions diminish in number in the air of a crowded room, but no relation has been established between alterations of ionization of the air and comfort While some people are very sensitive others are indifferent to the type of heater used in a room, or to the room's crowded state In the House of Commons some members complain greatly of the system of heating and ventilating used there , others say that it is very good Then again, there are some people who like open windows and others who call these ones ' open-air fiends " When the kata-thermometer was introduced by me as a measure of comfortable conditions I empirically fixed a cooling power of 6 for rooms in this temperate climate It takes a much higher cooling power—for example, 12 to 14—to increase the heat production of a man in ordinary clothing, so efficient are the means of the body for regulating heat loss The feeling of freshness given by a moderate cooling power is not due then to any change in the rate of heat production It is known, too, that alterations in relative humidity at ordinary room temperature from 40 to 70 per cent have no sensible effect on comfort Some people, however, put a bowl of water in front of a stove, and are made more comfortable by this, and yet such a bowl produces no detectable increase of humidity in the air

CAUSE OF " STUFFINESS "

All these facts receive an explanation when it is realized that a cause of discomfort and stuffiness is the quality of the infra red rays given off by the source of heat, and their effect on the naked parts of the skin The feeling of dryness and unpleasant quality of heat is due to direct action of irradiation on the skin, while stuffiness is due to a reflex congestion of the nasal membrane resulting from the action of the rays on the cutaneous nerves [2]

This reflex effect is pronounced in some with a deflected septum or with a chronic catarrhal and stuffy state of the nose It can be made evident to most of those who have widely open noses by means of a screw nose-clip adjusted to narrow the air-way until the breathing is only just adequate in cool air—for example by an open window Exposure of the face to a dull red or dark source of heat then makes the breathing difficult, while screening at once gives relief Cool air from an open window or fan antagonizes the " nose-closing " effect Hence sensitive people with stuffy noses like the open air and an open window, and dislike shut-up rooms heated by dark or dull red sources The less open side of the nose of a sensitive person may be sensibly obstructed by merely covering the face with the hand, or going under the bed-clothes The immediate discomfort felt on throwing a hood over the face may in part be due to this reflex The ' nose closing " effect is at once set aside by cooling the irradiated part of the skin, or other parts of the body, in this case to a sensible degree The open window in the bedroom prevents the stuffy effect and this is one of the benefits of open air treatment In cool air the mucous membrane is kept taut and with a better flow of blood and secretion

PRACTICAL APPLICATIONS

Cooling of the irradiated part of the skin by evaporation of sweat prevents the reflex When one sits down in a warm bath the reflex comes into play until the face is wetted A bowl of water set in front of a dull red and dark source of heat affords relief, because the vapour rising from it screens off some of the offending rays If set to one or other side of the source it ceases to be efficacious, but it can be placed anywhere between the source and the face of a sensitive subject and exert its " nose opening " action A glass screen is also protective In the case of some sensitive people the " nose closing ' effect is set aside by rays from a bright incandescent source acting either on the same or some other part of the skin Such a source gives off more of the short infra red rays and feels pleasanter The makers of modern gas fires have increased the radiant power and brightness of the clay " radiants," with the result that, while the old-fashioned gas fire was a " nose closer," the modern one is a " nose opener " The dull red electric fire is a " nose closer," but by increasing the current through a Ferranti bar fire from 5 to 6 amperes, and so making it brighter, the " nose-closing " effect was abolished A very little alteration then is required to make uncomfortable dull red sources of heat more comfortable A screen of gelatin, horn, or cellophane (acetyl cellulose) converts a bright source into a " nose closer " A study of the transmission of infra red rays by such screens made by Dr H J Taylor, shows that they absorb a group of infra-red rays about 30,000 A U These rays must be " nose-openers " Just like the physiologically active ultra-violet rays, these rays only just reach, in small intensity, the living cells of the epidermis and the nerve endings among them The prickly sensation of heat produced on the face by contiguity with an electric fire is relieved by switching on an incandescent lamp held close to the face, and best used with addition of a glass screen Most people then say " it feels cooler " The shorter infra-red rays, like the red rays, penetrate the skin and provoke flushing, transudation, and a moist skin The heat resulting from their absorption is carried away by the blood The long infra-red rays do not penetrate, and produce a dry and hotter surface The pleasanter feeling of bright sources seems to depend on this difference The bright sources also have more of the " nose opening " group of rays The standard kata thermometer cooling power of 6, which I had empirically fixed as comfortable is explained by the need to counteract by cool air the stuffy and unpleasant quality of dark heat rays

EXPERIMENTAL WORK

Miss Murray, at Bedford College, has recorded the " nose closing " reflex, the mouth being closed by a rubber gag, and the more open side of the nose plugged with cotton-wool, and has found about thirty out of sixty subjects are more or less sensitive In a few cases the breathing is obstructed and in others is made quicker and shallower

I have recorded the reflex effect by fitting the end of a rubber tube in one side of the nose (the best) and connecting this tube with a recording tambour The mouth being kept closed, the changes of pressure produced by breathing through the other side of the nose, are recorded by the tambour, which writes on a smoked drum The effects produced on one sensitive subject, Dr R , are

UNIVERSITY OF LONDON

EXTERNAL EXAMINERSHIPS, 1934

The Senate announce the following vacant Examinerships for the year 1934

For Final and Higher Examinations for Medical Degrees

MEDICINE SURGERY M D HYGIENE

For First Examinations for Medical Degrees

CHEMISTRY (TWO) GENERAL BIOLOGY PHYSICS

For Second Examinations for Medical Degrees

ANATOMY CHEMISTRY PHARMACOLOGY

Associate Examiners

Applications will also be invited for Associate Examiners in Medicine, Obstetric Medicine Pathology and Surgery A separate application form must be used for Associate Examinerships and the word Associate must be written on it

Application form (or forms if more than one Examinership is applied for) and particulars of the remuneration and duties can be obtained from the External Registrar

Candidates must send in their names to the External Registrar GEO I GOODCHILD M A B Sc, with any attestation of their qualifications they may think desirable on or before Monday July 3rd, 1933 (Envelopes should be marked Examinership)

The Senate desire that no application of any kind be made to individual members

If testimonials are submitted one copy only of each is required In no case should original testimonials be submitted If more than one Examinership is applied for, a separate and complete application must be forwarded in respect of each Examinership The appointments will be made by the Senate in November Applicants who desire that the result should be communicated to them are requested to enclose a stamped and addressed envelope with their application

University of London, South Kensington S W 7
EDWIN DELLER Principal
June 1933

THE ALL-INDIA INSTITUTE OF HYGIENE AND PUBLIC HEALTH CALCUTTA INVITES APPLICATIONS FOR THE FOLLOWING GAZETTED POSTS, Viz

(1) ASSISTANT PROFESSOR OF PUBLIC HEALTH ADMINISTRATION with additional experience in publicity and propaganda work
(2) ASSISTANT PROFESSOR OF BIO CHEMISTRY AND NUTRITION
(3) ASSISTANT PROFESSOR OF MALARIOLOGY AND RURAL HYGIENE (including Venereology and Tuberculosis)
(4) ASSISTANT PROFESSOR OF VITAL STATISTICS AND EPIDEMIOLOGY

Terms—Pay Rs 375—35—1 075 a calendar month Pay higher than initial rate might be given having regard to age and qualifications. Emoluments liable to revision if necessary in event of any grading down of pay of Public Services in India or of a decision by Bengal Government to revise rates of pay of similar staff of School of Tropical Medicine, Calcutta (Rupee 1s 6d approximately) The appointments are non pensionable but appointees will be eligible for the benefits of the Contributory Provident Fund (India)

Tenure—Five years in the first instance subject to six months notice on either side and extensible thereafter at the discretion of Government for such periods at a time as may be agreed upon A formal agreement will be executed with appointees provided they are not already in Government service in India

Leave—Appointees of non Asiatic domicile will be eligible for leave during agreement in accordance with Model Leave terms those already in Government service in India will be eligible for leave in accordance with Fundamental Rules or such other leave rules applicable to their service to those of Asiatic domicile special leave rules will apply Officers will be bound by the leave rules applicable to them and such revisions thereto as may be made from time to time

Passage—Free first-class passage to India also for candidates of non Asiatic domicile only similar return passage subject to usual conditions

All candidates will on appointment be regarded as serving in a vacation department on distinct understanding that withdrawal of this concession if and when found necessary will not entitle them to compensation No private practice including laboratory and consultant practice will be allowed

Forms of application may be obtained upon request by post card from the High Commissioner for India General Department India House, Aldwych London W C 2 where applications will be received up to July 1st, 1933 for transmission eventually to the Recruitment Board for the All India Institute of Hygiene and Public Health Calcutta

Candidates are liable to be required to attend for interview in England

---

THE GOVERNMENT OF INDIA INVITES APPLICATIONS FOR THREE GAZETTED APPOINTMENTS IN THE MEDICAL RESEARCH DEPARTMENT

Applications will be received only from European and Indian candidates who must be natural born British subjects and the children of British subjects, or statutory natives of India

Posts (a) and (b)—Applicants who must be qualified doctors and must not be members of the Indian Medical Service should have had considerable practical experience in Bacteriology and preferably have undertaken some research For post (b) at the Haffkine Institute, Bombay a thorough knowledge of modern technique of preparation of Plague vaccine is also required

Terms—Commencing pay will be fixed at a point in the incremental scale of Rs 625 – Rs 1 350 a calendar month commensurate with age and qualifications etc, and the pay will be subject to such temporary reductions (at present 5 per cent) as may be imposed by Government Sterling equivalents of Rs 625 and Rs.1 350 respectively at present rate of exchange (less 5 per cent) £534 and £1 154 per annum

Tenure—Permanent subject to satisfactory completion of a probationary period of three years Posts are non pensionable but on confirmation appointees are eligible for the benefits of a special provident fund

Passage—Free first class passage to India also for candiates of non Asiatic domicile only similar return passage, subject to usual conditions.

Strict medical examination

Post (c)—Applications are invited from and restricted to officers of the Indian Medical Service The selected officer who will also be required to serve a probationary period of three years, will be eligible for the pay of his rank plus a Bacteriological allowance of Rs 250 a calendar month

Forms of application may be obtained upon request by post card from the High Commissioner for India General Department India House, Aldwych London W C 2 where applications will be received up to July 1st, 1933 for transmission eventually to the Recruitment and Appointments Board for the Medical Research Department in India

Candidates are liable to be required to attend for interview in England

---

COUNTY COUNCIL OF MIDDLESEX

NORTH MIDDLESEX COUNTY HOSPITAL EDMONTON

RESIDENT PHYSICIAN

The County Council invites applications for the above appointment Candidates must be registered Medical Practitioners, Graduates in Medicine of a British University, and Fellows or Members of the Royal College of Physicians The successful candidate will work under the direction of the Medical Superintendent, will reside at the hospital, and will devote the whole of his time to his official duties.

Salary £600 per annum, rising by annual increments of £50 to £800 per annum together with residential emoluments valued for superannuation purposes at £150 per annum

In view of the national situation a temporary abatement calculated on the following scale is applied to the salary and value of the emoluments for the first £150 per annum, no abatement for the next £100 per annum 2½ per cent abatement for the next £500 per annum, 5 per cent abatement for the next £750 per annum 7½ per cent abatement

The successful candidate will be required to pass such medical examination as the Council may direct, and unless subject to the Poor Law Officers Superannuation Act 1896 to contribute to the County Councils Superannuation Fund The appointment will be held during the pleasure of the Council and subject to three months notice on either side

Applications stating (1) name (2) age (3) qualifications and (4) experience, together with copies of not more than three recent testimonials must be received by the undersigned not later than June 24th

No special application forms are provided Envelopes must be endorsed Resident Physician"

Canvassing directly or indirectly will be a disqualification

N B—North Middlesex County Hospital is a modern General Hospital with accommodation for 900 cases chiefly acute 215 beds in the adjoining Edmonton House also are under the care of the Medical Staff of the Hospital The Hospital possesses a Pathological Laboratory, and Radiological Radium Electrotherapeutic, Actino-therapeutic Maternity Massage Ear Nose and Throat Ophthalmic Dental, and Out patient Departments

WARRINGTON INFIRMARY AND DISPENSARY

The Board of Management invite applications for the post of JUNIOR HOUSE SURGEON (male) unmarried

Applicants who must be of British nationality must be duly qualified Medical Practitioners.

Salary £175 per annum with board apartments and laundry

Applications stating age with copies of three recent testimonials should be sent in at once to the undersigned

By Order
HENRY J FOOT
Supt & Secretary

May 30th 1933

PRESTON AND COUNTY OF LANCASTER ROYAL INFIRMARY

Applications are invited from unmarried gentlemen, properly qualified and registered for the post of HOUSE SURGEON in the Departments with resident care of the Male Department (16 beds) and Eye Ear Nose and Throat (27 beds)

Salary at the rate of £150 per annum with board residence and laundry

Applications stating age qualifications and previous experience to date with copies of testimonials to be forwarded to the undersigned on or before June 16th

JOHN GIBSON Supt

INDIAN MEDICAL SERVICE

Recruitment of European Officers.

Applications are invited from medical men for permanent commissions in H.M.'s Indian Medical Service. The terms offered include a gratuity of £1,000 on retirement after six years' service, or £2,500 after 12 years' service, together with free return passages for those who no longer desire to remain in the Service. In other respects the terms will be as detailed below.

Candidates must be European British subjects under 32 years of age at the time of application and must be registered under the Medical Acts in force in Great Britain and Northern Ireland.

CAREERS

The Indian Medical Service offers wide opportunities of medical experience including clinical preventive specialist and research work. At the beginning of his career an officer is employed on the military side which has medical charge of the Indian Army. Promotion is on a time scale up to the rank of Lieutenant-Colonel and by selection to the ranks of Colonel and Major-General. An officer may apply after one year's Indian Service to have his name registered for transfer to the civil side from which appointments are made to Civil Surgeoncies which are established at the principal civil centres to provide for the medical needs of civil officials and for general medical administrative purposes to specialist (for example public health and bacteriological) services to research posts and to professorships at the Medical Schools.

NOTE.—It is not possible to state at present what if any prospects of employment on the civil side will be open to Indian Medical Service Officers under the proposed new constitution for India.

PAY

Owing to the state of the financial emergency at present prevailing in India the existing monthly rates of pay which are as follows are subject to a temporary reduction of 5 per cent.

Rank.	Service in Rank.	Basic Pay	Overseas Pay	Year of Total Service
		Rs.	Rs.	
Lieut.	—	400	100	1st
			100	2nd
			100	3rd
Capt.	(i) During first 3 years service as Captain	600	100	4th
			£15	5th
			£15	6th
	(ii) With more than 3 and less than 6 yrs. service as Captain	700	£25	7th
			£25	8th
			£25	9th
	(iii) With more than 6 years service as Captain	800	£25	10th
			£25	11th
			£50	12th
Major	(i) During first 3 years service as Major	900		
	(ii) With more than 3 and less than 6 years service as Major	1100		
	(iii) With more than 6 years service as Major	1200		
Lieut.-Col.	(i) Until completion of 23 years total service	1 000	£50	13th and over
	(ii) During 24th and 25th years service	1600		
	(iii) After completion of 25 years total service	1 000		
	(iv) When selected for increased pay	1800		

EXTRAS.—In addition to the above rates various allowances are admissible for a large number of special appointments on both the military and the civil side which may be held by members of the Indian Medical Service. Special high rates of pay are also attached to the numerous administrative appointments open to officers in both branches of the Service.

ANTEDATES IN COMMISSION

Any service rendered by an officer during the war as a medical or combatant officer or in a position usually filled by an officer may be counted as service for increments of pay promotion retirement and retired pay but not for gratuity.

One half of any service in the ranks during the war may be counted as service for retirement and retired pay only.

Candidates possessing certain higher medical qualifications may be granted an antedate of one year in their commissions. Past service in certain hospital appointments may also render candidates eligible for an antedate of one year. Persons holding or about to hold resident posts at recognized hospitals may be seconded in those posts for a period not exceeding one year. The maximum period of an edate secondment or antedate and secondment combined admissible under this paragraph is limited to one year.

OUTFIT ALLOWANCE

Officers on appointment will receive an allowance of £50 towards the cost of outfit.

PRIVATE PRACTICE

With the exception of Administrative Officers military or civil and officers holding certain special appointments officers are not debarred from taking private practice so long as it does not interfere with their proper duties.

LEAVE

Leave can be taken at reasonable intervals and adequate rates of leave pay are provided. Extra leave (known as study leave) which may not exceed 12 months in all during an officer's service may be granted to officers desirous of pursuing special courses of study of a post graduate nature. During such leave study allowance at present fixed at the rate of 12s. a day in the United Kingdom £1 a day on the Continent of Europe and £1 10s. a day in the United States of America is granted to an officer in addition to ordinary rates of leave pay.

PENSIONS

The rates of pension are as follows	Per annum £
After 17 years service for pension	400
18	430
19	460
20	500
21	540
22	580
23	620
24	660
25	700
26	750
27	800

These rates are subject to alteration on account of a rise or fall in the cost of living as compared with the year 1919 to an extent not exceeding 20 per cent. in all. At present a reduction of 8½ per cent. is being made on this account.

There are additional pensions ranging from £65 to £350 per annum for officers who have held administrative appointments.

PASSAGES

An officer on appointment is provided with free passage to India. The families of officers who are married prior to the date of the officers embarkation on first appointment will also be provided with free passage to India subject to the payment of messing charges.

Officers and their families are also eligible for passage concessions under which they are granted a certain number of return passages home at Government expense during their service.

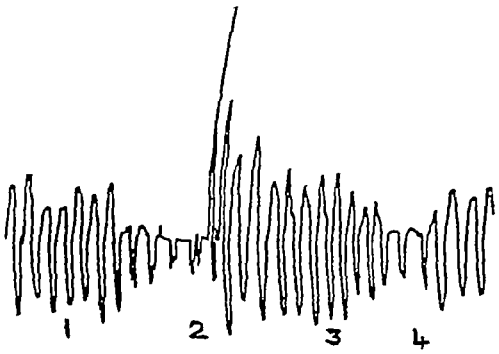
INSTRUCTION PRIOR TO EMBARKATION

Officers are required to undergo courses of instruction at the Royal Army Medical College and at Aldershot lasting approximately six months prior to their embarkation for India on first appointment. Information as to the rates of pay admissible during this period and subsequently up to arrival in India is contained in the memorandum referred to below.

A memorandum giving full details regarding these appointments and forms of application may be obtained from the Under-Secretary of State for India, Military Department, India Office, London, S.W.1. The Selection Committee will meet at the India Office early in July next and the selected candidates will be required to join a course of instruction commencing early in August prior to sailing for India early in 1934. Applications should be submitted as soon as possible.

shown in the figure I also use a mask which covers the mouth and nose The mouth is closed and nasal breathing takes place through an orifice in the mask which is so restricted that step-climbing can just be comfortably carried on in a cool room The steps are made on and off a box in time with the beats of a metronome On allowing the rays from a dull red electric fire to fall on the face the step-climbing soon becomes impossible in a sensitive subject through want of air On switching on a fan or an incandescent lamp ease in step-climbing is renewed The experiment can be carried out with the fire put under the table so as to radiate the bare legs The screen in front of the fire can then be withdrawn silently by an observer while the eyes of the subject are kept shut The eyes should not be covered by a bandage because this in itself affects the nose of a sensitive subject

Inhalation of a vaporized adrenaline solution abolishes the reflex nose-closing effect. The adrenaline constricts the blood vessels and preventing vascular congestion of the membrane keeps the air way open The effect of the inhalation lasts for an hour or so The sensitivity of the skin to the nose-closing rays in certain sensitive susceptible subjects is very great When only one square inch of skin is exposed and the device is put several feet away the reflex may result In a still room at ordinary temperature I was sensitive to the nose-closing rays of an electric fire when facing this at a distance of 47 feet where of course no sensation of heat was felt At a distance of 1 metre from a thermopile the energy of an incandescent lamp was found to be 1/60 of that of an electric fire When one square inch of skin was exposed at that distance to this fire the bad side of my nose became closed when another and equal area of skin was exposed to the lamp the nose was opened The latent time in each case was about six seconds The latent time is much shorter when a large area of skin is exposed the effect varied as $\sqrt{a}t$ where a = the area and t = the time At various distances from the source the effect varies as $\sqrt{i}t$ where i = intensity and t = time



Tracing shows effect on nasal breathing of electric fire fan and incandescent lamp (1) Exposed to electric fire (2) opened mouth to take a breath fan then put on and nasal breathing resumed (3) fan stopped (4) incandescent lamp switched on

Out of sixty seven subjects recently tested at the London Clinic and Institute of Physical Medicine fifteen were insensitive while forty two showed more or less evidence of the nose-closing effect Asthmatic and catarrhal patients are likely to be more sensitive than others In all except four of these forty two the fan made the breathing easier while twenty five found it made easier by the incandescent light, and twenty one by the water bowl

Conclusion

In considering the various baths used for stimulating the skin and producing curative effects it is of interest to have found evidence of a reflex effect of a striking character In my case the nose-closing effect is accompanied by a slight rise of blood pressure In regard to heating and ventilating rooms it is clear that where dark sources of heat are employed there should be adequate ventilation with cool air This is required not only to produce comfort and a feeling of freshness but to keep the atmosphere as clean as possible from dust and microbes Incandescent lamps make such sources pleasanter Electric fires can be improved by making them brighter sources of heat A sensitive subject who suffers from nasal catarrh has been improved by replacing in his room a hot water radiator by a Ferranti bar fire which was made to take 6 amperes Irradiated with this bright heat he works in comfort with a window open and has better health A modern gas fire would have done as well

REHALATIONAL ANAESTHESIA

A METHOD OF UTILIZING THE RECENT ADVANCES IN ANAESTHETIC ADMINISTRATION

BY

JOHN HALTON M.B CH.B

HONORARY ANAESTHETIST LIVERPOOL ROYAL INFIRMARY

General inhalational anaesthesia to-day is induced and maintained either by one of the modern types of apparatus or by the time honoured open mask and drop bottle Apparatus is of the greatest importance in the anaesthesia of modern surgery In many operations on the head and neck and in thoracic surgery it is essential It is not my object in this article to decry its use but to try and show those who are called upon to give routine or occasional anaesthetics that by adopting a combination of methods of administration which have been advocated from time to time, they can secure practically all the very real advantages of the more costly and complex apparatus by a technique which rivals the open mask for simplicity and economy

The mechanization of anaesthesia is the outcome to a great extent of the practical application of the results of recent research discoveries which cannot be employed when the open mask is used.

Results of Recent Research

Haggard[1] has shown that narcosis depends upon the anaesthetic tension of the agent exhibited which in the case of ether is that concentration of the vapour with which the cells of the central nervous system are in equilibrium This equilibrium is only reached after gaseous interchanges have taken place first between the pulmonary blood and the vapour bearing air entering the lungs and then between this blood and the tissues Furthermore owing to the high absorption quotient of lipoid tissue and the volume of blood passing through the central nervous system this concentration practically equals that of the arterial blood Thus the rate of absorption depends solely on the amount of ether brought to the blood and this depends on the volume of respiration He has shown by experiment that to maintain a state of

surgical anaesthesia the blood must contain 1 to 1 5 grams of ether per litre This necessitates, during induction, introducing to the lungs 8 to 12 grams of ether per minute To attain this with ordinary respiratory excursions, which at the commencement of anaesthesia are often rendered shallow by depressant hypnotics, entails the use of a prohibitively strong vapour, a long induction period with gradual saturation of the whole body, or increasing the depth and volume of respiration, so diluting the vapour strength One gram of ether in one litre of air per minute is as effective for anaesthesia as one gram in five litres per minute

The work done by Haldane[2] on carbon dioxide is a respiratory hormone is so well known that a brief reference to his conclusions will suffice He finds that a rapid induction and termination are essential , the use of rebreathing tends to lessen variations of ether–air composition and the use of carbon dioxide stabilizes the acid-base balance of the blood, and by stimulating respirations ensures full lung expansion, definitely lessening post-operative complications

The toxic effects of ether have been the subject of research since 1850 Stephen[3] gives a very thorough review of this work, and adds valuable facts from her own investigations It is admitted that conservatism in the amount of ether used spares the body tissues and metabolism Ross and Fairlie[4] quote Gwathmey as laying stress on the necessity of warming the vapour, claiming that " this measure will prevent the loss of heat to the patient incidental to the warming up in the air passages, of the cold vapour " Shipway and Pembry[5] show that body heat can definitely be maintained by warm vapour, and Hewer[6] describes the irritating effect of too hot vapour and the loss of body heat by sweating when it is used

In considering the open mask, Rowling[7] has proved clinically that when it is in use the oxygen percentage under it is always reduced and the percentage of carbon dioxide is variable and not maintained Finally, Flux[8 9] has shown that use may be made of the density of anaesthetic vapours, while Miller[10] has gone a step further with his gravitational anaesthesia, showing that this is particularly applicable to ether vapour, nitrous oxide, carbon dioxide, and oxygen, with densities greater than air

COMPARISON OF METHODS

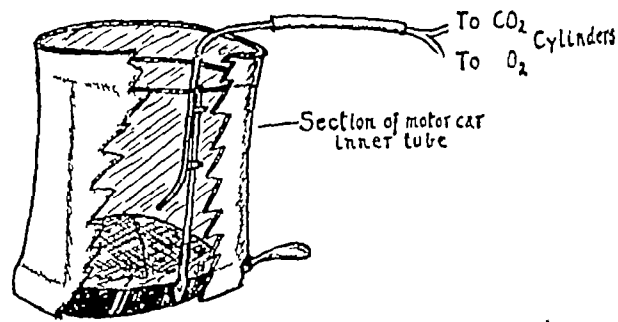
The salient points, therefore, in our present knowledge of the theory and practice of narcosis are rapid induction, usually by nitrous oxide and oxygen with carbon dioxide , rebreathing to warm the vapours and to keep up the carbon dioxide content of the inspired gases with added oxygen and sufficient warmed ether only to saturate the nervous system or as an adjuvant to nitrous oxide Most forms of apparatus aim at utilizing these facts, and the results obtained by anyone accustomed to the apparatus used are excellent from every point of view—from that of the patient the surgeon, and the administrator But gauges and taps are not infallible they may become refractory at critical moments or their readings may be incorrect Also most of the apparatus is costly, and would be employed by many anaesthetists too infrequently to warrant acquisition Lastly, there is the fact that when apparatus is used the anaesthetist's attention is divided, and the temptation may arise to discard the reactions and minute-to-minute symptomatology of the patient for dial readings

On the other hand, when an anaesthetic is administered by the open mask even when carbon dioxide is used owing to the difficulty of controlling respiration, there is a longer induction period with a retarded recovery rate, and a greater tissue saturation is needed before any required level of anaesthesia is attained Again from the purely physical standpoint the method is unscientific, because of the specific gravity of the gases used, and ether vapour as it falls from the mask is often inhaled by all the theatre staff as well as by the patient—a very important point during a full day's work The almost unavoidable freezing of the gauze of the mask, and the constant presence of cold ether vapour and droplets in close approximation to the patient s face, are further disadvantages of the open mask method

APPARATUS AND TECHNIQUE

During the past two years I have evolved a technique which I believe has a very definite position in routine anaesthesia between these two extremes I have named it rehalational anaesthesia, because it takes its place between perhalation with the ordinary mask and rebreathing into a bag

The ' apparatus," at its simplest, consists of a small cylinder of oxygen and a ' J " size carbon dioxide sparklet, which are strapped together, tubes from which are brought to a Y-piece, whence a further tube leads the gases to the mask , a four ounce ether drop bottle with a Bellamy Gardner dropper, the delivery pipe of which is nipped up so that it will deliver an even drop in any position , and a modified Ogston mask, a short description of which was published in the *British Medical Journal* in April, 1930 [11] Two slight modifications have been made since then , first a section of motor car inner tube is slipped over the frame and takes the place of the towel or lint which Ogston suggested and secondly, a short length of metal tube is clipped to one of the uprights, as indicated in the sketch, and the



Section of mask made up indicating lead in tube

gases are, by this means, led to the depths of the mask In use the mask is made up, the gas tube attached, and induction commenced

INDUCTION

Ether, chloroform and ether mixture, or ethyl chloride, can be employed The most pleasant, however, is nitrous oxide , when this is used an extra gas tube fitted to the mask is advantageous If plain ether is chosen a few drops are allowed to fall, not on the dome of the gauze, but at the side away from the direct line of the mouth and nose, while the mask is gradually lowered on to the two thick layers of gamgee covering the patient s face The dropping is slow, and if any gagging or signs of discomfort appear the mask must be lifted momentarily Before the mask is quite lowered the carbon dioxide is turned on so that the gas just flows, gauged by the bu s in the tube The breathing deepens, and it is found that a steady increase in drop rate is comfortably tolerated until the patient passes rapidly and quietly into surgical anaesthesia Very deep breathing before this stage must be avoided , it will cause a sense of suffocation and in crease any tendency to cyanosis If these conditions do appear there is no necessity to shut off the gas it is sufficient to raise the mask slightly for a few seconds

In the case of mixture induction for patients who are not morphinized seven parts of ether to one of chloroform has proved the most satisfactory The chloroform helps to mask the pungency of the ether and it will rarely be found necessary to use the sparklet at all enough carbon dioxide being retained inside the mask chamber from the patient's own expirations A regular drop is maintained until steadiness and increased depth of respiration denotes the establishment of anaesthesia 1 to 1½ drachms is usually sufficient for this A change is then made to pure ether any gagging or breath holding being immediately dealt with by means of the sparklet

With ethyl chloride a very rapid induction is secured by dropping 3 to 5 c.cm gradually on the mask and as soon as sterterous breathing denotes full anaesthesia sufficient ether is used to ensure that the whole of the gauze is moist Any respiratory irregularity exhibited as the patient comes from deep ethyl chloride to light ether anaesthesia can be dealt with by the sparklet

In nitrous oxide induction a second tube is led from the gas cylinder to the mask the gas is turned just on the mask is lowered slowly and as the stertorous breathing and characteristic dusky colour of this anaesthesia begin to show a few breaths of carbon dioxide are given the nitrous oxide is disconnected and an increasing ether drop is commenced until surgical anaesthesia is attained A little practice is perhaps necessary with this method of inducing narcosis for care must be taken that nitrous oxide anaesthesia is not pushed to the jactitation stage when respiratory cessation bars further progress Should this occur it can be corrected by a few breaths from the oxygen cylinder

Whatever form of induction is used the anaesthetic room should be kept quiet and no adjustment of dressings and clothes is permissible until full narcosis is reached Much will be added to the confidence of patients and to the alleviation of fear by a short preliminary conversation as to how easily they will fall asleep and since the auditory sense is one of the last to be abolished—a fact often overlooked—this reassurance with simple directions as to their conduct should be kept up until consciousness is lost This is probably better than the practice of counting which in my opinion, tends to have the opposite effect Finally as soon as the jaw muscles permit an airway is inserted

Maintenance

With anaesthesia fully established the carbon dioxide is turned off the patient is evolving and rebreathing his own carbon dioxide from the mask chamber Respirations are deep and full and there is a slight tendency to cyanosis sufficient oxygen is turned on to counteract this It will be found that ether can now be dropped almost as sparingly as chloroform No freezing of the gauze will take place provided the drops are not directed constantly to one portion of the mask In actual practice unless a deep level of anaesthesia is required when the whole of the gauze is moist the drops should be directed to the sides of the mask

With this form of administration two further important points must be borne in mind First a constant and regular ether dropping is essential secondly since deep levels of anaesthesia are reached much more rapidly than in open administration the difficulty to those experienced only in that method will not be so much in keeping the patient deep as in allowing him to ascend to lighter levels

Recovery

Following the final deepening of anaesthesia to facilitate the closure of the peritoneum the ether dropping can be discontinued Thus by the time the surgeon is closing superficial tissues no ether remains on the mask Six full breaths of carbon dioxide are given from the sparklet and the patient is allowed to inhale with the resultant increased respiration an atmosphere rich in oxygen for the remainder of the time he is on the table After an abdominal operation of the average length when atropine only has been used in premedication the patient leaves the theatre phonating with his essential reflexes present and is usually awake in a further sixty to ninety minutes In the presence of morphine however the final recovery is delayed

It is appropriate to indicate here further simple additions to technique which may be made with advantage In gall bladder surgery of the obese and in cases where an abnormal posture is required the introduction as an airway of a pernasal endotracheal catheter as advocated by McGill [12] will simplify administration giving an even greater control of the patient and rendering the operating field less disturbed by excessive respiratory excursions The use of a simple vaporizing apparatus—such as that of Shipway or of Howard Jones—to replace the drop bottle is a further refinement Some form of flow meter may be introduced into the gas circuit if accurate measurement of the gases is considered desirable

RATIONALE AND ADVANTAGES

What benefits accrue from this technique and how are they brought about? Use is made of all Henderson's tenets for a good anaesthesia Because of the arrangement of partial rebreathing a more constant air mixture is maintained in the lung and this assisted by the addition of carbon dioxide ensures a constantly quiet induction in every type of case with very little experience on the part of the administrator Because of the form of the mask every drop of ether is warmed and vaporized by the patient's own efforts the vapour being concentrated to him alone thus protecting the anaesthetist the operator and the theatre staff

The usual amount of ether used from induction to termination for an adult male undergoing an upper abdominal operation lasting from forty to sixty minutes is six ounces—rarely more often less From this it will be seen that patients anaesthetized by this method are a totally different proposition to those anaesthetized by the open mask In the latter owing to the uncontrolled respiratory excursions deepening of anaesthesia is only secured by the exhibition of a very strong vapour with all it entails—wet and frozen gauze and the use of excessive quantities of ether etc.—so that the whole organism is soaked with the drug and the venous return to the lungs carries sufficient absorbed vapour with it to aid in the building up of the required concentration in the arterial blood This in its turn results in a slow return to lighter anaesthesia and subsequent recovery and because of the toxicity of ether there is the danger of interference with the metabolism and damage to the body cells

On the other hand with rehalational anaesthesia although the concentration in the arterial blood must be the same it is secured much more rapidly by slightly increasing the vapour strength inhaled by the controlled respirations Should this be insufficient to give the depth of anaesthesia required the respirations and therefore the concentration can further be increased by the use of the sparklet When the need for deep anaesthesia passes if the ether dropping ceases recovery is as rapid for the converse of Haggard's findings holds good and the elimination of ether depends upon the volume of respiration Thus by directing the drug practically wholly to the central nervous system an identical degree of anaesthesia can be attained without exposing the rest of the body to toxic doses of ether

CITY OF BIRMINGHAM MENTAL HOSPITAL.

JUNIOR LADY ASSISTANT MEDICAL OFFICER

The Committee of Visitors invite applications for the above wholetime appointment from ladies under 35 years of age who are duly qualified and registered Medical Practitioners. A person who has held for at least six months a medical or surgical residential post in a general hospital will be regarded as having an additional qualification.

The successful candidate should be a good anaesthetist.

She will be required to reside in the hospital.

The commencing salary will be £300 per annum plus the usual residential emoluments of board, lodging, laundry and attendance. Subject to 12 months' service satisfactory to the Committee an increase of £50 will be granted and thereafter increases of £25 per annum up to a maximum salary of £450 per annum. An additional £50 per annum will be paid to the holder of the D.P.M. qualification or to a person obtaining the D.P.M. after appointment. The salaries and emoluments will be subject to a temporary deduction in accordance with the Scale of Temporary Abatements from Salaries approved by the City Council. The salaries are inclusive of all fees received and no such fees must be accounted for and paid into the hospital account.

The successful candidate will be required to pass satisfactorily a medical examination and to join the scheme under the Asylums Officers Superannuation Act, 1909. She will be required to serve in such institution belonging to the Mental Hospital Committee as they may from time to time direct. The appointment is subject to one month's notice on either side.

Applications stating full particulars of qualification, experience and appointments held, accompanied by copies of three recent testimonials must be addressed to the undersigned so as to be received not later than June 24th.

F. H. C. WILTSHIRE,
Town Clerk. Office Clerk to the Council House Committee of Visitors
Birmingham. May 25th, 1933.

HAMPSTEAD GENERAL AND NORTH WEST LONDON HOSPITAL, Haverstock Hill, N.W.3.

APPOINTMENT OF A HOUSE SURGEON

Applications are invited from unmarried Medical Men for an appointment of House Surgeon vacant on July 1st next. The salary will be at the rate of £100 per annum together with board, residence etc. and the term will be for six months.

Application to be made on a form which will be supplied by the Secretary, together with copies of not more than three testimonials, should reach the Secretary not later than noon on Jan. 17th next.

ELLINA HOSPITAL FOR SICK CHILDREN, Southwark, S.E.1.

Applications are invited for the post of HOUSE PHYSICIAN (male) for six months from July 1st (first two months in Casualty and Out-patient Department). Salary at the rate of £120 per annum with board and residence.

Applications stating age, experience and qualifications, accompanied by copies of four testimonials, to be sent to the undersigned not later than June 20th, from whom rules and other particulars can be obtained.

By Order of the Committee of Management.

W. H. SIDWELL,
May 24th, 1933. Secretary Supt.

COVENTRY & WARWICKSHIRE HOSPITAL.
307 Bed Main Hospital.
40 Beds Convalescent Hospital.
(Seven Resident Medical Officers.)

Applications are invited for the posts of RESIDENT HOUSE SURGEON and CASUALTY OFFICER (male). Duties to commence on July 1st. Salaries at the rate of £125 per annum with board, lodging and attendance. Candidates must be duly qualified and registered.

Applications stating age and enclosing copies of recent testimonials, to be sent to the undersigned on or before June 14th.

(MISS) R. HOOPER,
May 27th, 1933. Secretary.

CLAYTON HOSPITAL, WAKEFIELD.
(General Hospital—166 Beds.)

Applications are invited for the post of HOUSE SURGEON (male British). The appointment is for six months in the first instance and the salary is at the rate of £200 per annum together with board, residence and laundry.

Application, stating age, qualifications and experience, together with copies of three recent testimonials, should be sent to the undersigned as early as possible.

H. J. LANCASTER, Gen. Supt. & Sec.

WOOLWICH AND DISTRICT WAR MEMORIAL HOSPITAL,
Shooters Hill, London, S.E.18.
GENERAL HOSPITAL—112 Beds.

HOUSE PHYSICIAN also HOUSE SURGEON

The Board of Management invites applications from suitably qualified male candidates for appointment as (a) House Physician and (b) House Surgeon for a period of six months from July 1st next. In addition to his surgical duties the House Surgeon will have the care of a Maternity Unit of 8 beds.

An honorarium of £100 per annum will be paid in respect of each appointment, plus board, residence and laundry.

Applications, accompanied by copies of not more than three recent testimonials, should be addressed to the Secretary (at the Hospital) to reach him not later than Monday, June 19th. The Appointments Committee will meet on June 23rd to interview such of the candidates who will be duly advised when and where to attend.

NORFOLK AND NORWICH HOSPITAL,
NORWICH. (392 Beds.)

Applications are invited for the following posts:—

(a) HOUSE SURGEON.
(b) HOUSE PHYSICIAN.

Preference will be given to candidates who have held previous appointments. Salary for both posts £120 per annum with board, residence and laundry.

Candidates (male) who must possess registered qualifications, should forward applications, stating age, nationality, etc., together with copies of testimonials, to the undersigned not later than the first post in Tuesday, June 20th.

FRANK INCH,
June 7th, 1933. House Governor & Secretary.

ELSIE INGLIS MEMORIAL MATERNITY HOSPITAL,
Spittal Street, EDINBURGH. (60 Beds.)

Applications are invited from fully qualified Medical Women for the following posts:—

1. DISTRICT MEDICAL OFFICER, rising to Senior House Surgeon after three months, honorarium at the rate of £50 per annum with board, residence and laundry.
2. JUNIOR HOUSE SURGEON, honorarium at the rate of £25 per annum with board, residence and laundry.

The appointments are for six months from July 1st. Applications, with copies of testimonials to be sent to the Secretary, 1 Brunstane Road, Craigmillar, Edinburgh, immediately.

EDINBURGH HOSPITAL FOR WOMEN AND CHILDREN,
Whitehouse Loan, EDINBURGH. (56 Beds.)

Applications are invited from fully qualified Medical Women for the post of JUNIOR HOUSE SURGEON, rising to Senior House Surgeon after three months.

Appointment for six months from July 1st, honorarium at the rate of £25 per annum for first three months, £50 per annum for second three months, with board, residence and laundry.

Applications, with copies of testimonials to be sent immediately to the Secretary, 1 Brunstane Road, Craigmillar, Edinburgh.

THE PRINCESS BEATRICE HOSPITAL,
Richmond Road, Earl's Court, S.W.5.
(General Hospital—80 Beds.)

RESIDENT MEDICAL OFFICER (male) required to act as House Surgeon and Casualty Officer for six months from July 1st. Salary at the rate of £110 per annum with board, residence and laundry. Previous resident experience essential.

Applications to be sent to the House Governor not later than June 20th, accompanied by copies of three recent testimonials.

WATERLOO AND DISTRICT GENERAL HOSPITAL, WATERLOO,
Near LIVERPOOL.

HOUSE SURGEON required as from July 1st. The candidate must be fully qualified and registered. Remuneration at the rate of £100 per annum with board, residence and laundry.

Applications with copies of testimonials to be sent to the undersigned on or before June 15th.

W. T. EMERY,
Hon. Secretary & Supt.

YORK COUNTY HOSPITAL.
(200 Beds.)

The post of HOUSE PHYSICIAN will become vacant on July 1st. Salary £150 per annum with board, residence and laundry.

Applications, stating age and previous experience, together with copies of not more than three recent testimonials to be sent to the undersigned not later than 9 a.m. on Tuesday, June 20th.

H. E. RYAN, Gen. Sup.

THE GENERAL INFIRMARY AT LEEDS.

HONORARY ASSISTANT SURGEON.

Notice is hereby given that a Meeting of the Special Election Committee will be held in the Board Room on July 7th to elect an Honorary Assistant Surgeon.

Information as to the duties and necessary qualifications for the office will be supplied on request to the House Governor.

Thirty two copies of application, each accompanied by not less than three recent testimonials, to be addressed to the Chairman of the Infirmary, should be sent in on or before June 23rd.

By Order of the Board of Management,
S. CLAYTON FEYELS,
House Governor & Secretary.

THE GENERAL INFIRMARY AT LEEDS.
(627 Beds.)

(1) TWO JUNIOR RECEIVING ROOM OFFICERS (Candidates must have held a previous resident House appointment).

(2) RESIDENT MEDICAL OFFICER, Ida Robert Arthington Hospital.

Applications are invited for the above posts. Salaries (1) £100 per annum and (2) £60 per annum with board, residence and laundry.

The appointments are for six months, subject to renewal. Candidates must be legally qualified and registered.

Application with copies of testimonials to be sent in at once to the House Governor and Secretary.

June 2nd, 1933.

SOUTH DEVON AND EAST CORNWALL HOSPITAL, PLYMOUTH.
(240 Beds.)

Applications are invited for the post of HOUSE PHYSICIAN.

Salary £120 with board, residence and laundry.

Appointment tenable for six months, and subject to renewal.

Duties to commence July 1st.

Applicants must be registered under the Medical Acts.

Applications, stating age, and qualifications with copies of three recent testimonials, to reach the undersigned by June 21st.

ARTHUR R. CASH,
General Superintendent & Secretary.

WEST END HOSPITAL FOR NERVOUS DISEASES.
In-Patient Department, Gloucester Gate, Regent's Park.
Out-Patient Department, 73 Welbeck St., W.1.

The Committee of Management invite applications for the post of HON. ASSISTANT OPHTHALMIC SURGEON. Candidates who must be Fellows of the Royal College of Surgeons, England, are required to send twenty copies of their application with recent testimonials not later than Monday, June 19th to the undersigned from whom further particulars should be obtained.

J. P. WETENHALL,
Wellbeck Street, W.1. Secretary.

MANSFIELD AND DISTRICT HOSPITAL.

The Board of Management of the above Hospital (135 beds) invite applications for the post of HOUSE SURGEON (male). Duties to commence July 1st next.

Salary at the rate of £150 per annum, with residence, board and laundry.

The appointment is for six months, renewable.

The Resident Staff consists of a Resident Surgical Officer and two House Surgeons.

Applications accompanied by not more than three recent testimonials to be sent to the undersigned.

Dated this 31st day of May, 1933.

C. J. ADAMS, Secretary.

DISTRICT INFIRMARY,
ASHTON-UNDER-LYNE.
(General Hospital—200 Beds. Mainly Surgical.)

Wanted a HOUSE SURGEON for six months' appointment.

Salary at the rate of £150 per annum, with board, residence and laundry.

The Resident Staff comprises a Resident Surgical Officer and three House Surgeons.

Applications with testimonials to be sent at once to the undersigned.

FRANK OLIVER,
June 5th, 1933. Gen. Supt. & Secretary.

CHESTER ROYAL INFIRMARY.
(211 Beds.)

HOUSE PHYSICIAN (male) required as from July 15th. Salary £150 per annum, with board, lodging and washing. Applications close June 22nd. Application forms may be obtained from W. H. GRACE, M.D., M.R.C.P., Hon. Superintendent of the Resident Medical Staff.

Applications with copies of testimonials, stating age, nationality experience, etc, to be sent at once to the undersigned

Royal Infirmary, NATHAN A. SMITH
Blackburn Gen. Supt. & Secretary

This Institution is recognised for the Surgical Practice required for the F.R.C.S. final examination

---

ADDENBROOKE'S HOSPITAL CAMBRIDGE

Applications are invited for the post of RESIDENT ANAESTHETIST AND EMERGENCY OFFICER (male) The appointment will be for three months from July 1st Salary at the rate of £130 per annum with board residence and laundry Candidates who must be unmarried and duly registered are requested to forward their applications, stating age qualifications etc together with copies of not more than four recent testimonials to the undersigned on or before Wednesday, June 14th

W. H. HEAD
Secretary Superintendent

LINCOLN COUNTY HOSPITAL

Wanted HOUSE SURGEON male, unmarried Salary at the rate of £150 per annum rising to £200 per annum at the conclusion of six months approved service Board residence and washing will also be provided

Every candidate for the appointment must be registered under the Medical Acts

Applications stating age and other particulars with copies of not more than three testimonials are to be sent to the undersigned from whom further particulars may be obtained.

ARTHUR MOORE
Lincoln Secretary Supt

ROYAL ALBERT HOSPITAL AND EYE INFIRMARY DEVONPORT

A vacancy for an ASSISTANT HOUSE SURGEON exists Applicants must be duly registered and unmarried and the appointment will be for six months Salary £100 p.a. with board apartments and laundry free

Application stating age accompanied by copies of not more than three testimonials should be forwarded to the undersigned without delay

By Order of the Committee
FRANK ROWE
May 22nd 1933 Secretary

ALTRINCHAM GENERAL HOSPITAL.
(100 Beds)

Applications are invited for the post of JUNIOR HOUSE SURGEON Salary £120 per annum with board residence and laundry

The appointment is for six months in the first instance to commence July 1st

Applications stating age and experience together with copies of recent testimonials to be sent to the Secretary General Hospital Altrincham not later than June 15th

---

CANDIDATES INVITED FOR POST OF HON. RADIOLOGIST HENDON KING EDWARD MEMORIAL HOSPITAL N.W.4 Particulars on request at the Secretary of Hospital Applications for post must be in before June 19th

---

NORTHAMPTON GENERAL HOSPITAL
(253 Beds)

There are vacancies immediately for a HOUSE SURGEON for one of the General Honorary Surgeons and a HOUSE SURGEON for the Ear Nose, and Throat Department British nationality Salary £150 per annum, with board, residence and laundry

The successful candidates will be appointed for the period ending on September 30th and will be eligible for re-election for a further period of six months.

Candidates must be duly qualified and registered

Applications stating age sex qualifications etc with copies of testimonials to reach the undersigned not later than first post on Wednesday June 21st

H. ST JOHN WOOD
June 9th 1933 Secretary Supt

NOTTINGHAM GENERAL DISPENSARY GREGORY BOULEVARDE BRANCH NOTTINGHAM

Wanted RESIDENT SURGEON (female) unmarried Must have Medical and Surgical qualifications Salary £250 with £25 increase per year up to £300 House with attendance, lights and fuel (not board) This institution is a non-provident one No beds No midwifery Applications stating age and accompanied by copies of recent testimonials to be sent by June 13th to—

5 Thurland St R. J. WILLATT
Nottingham Secretary

THE CHILDREN'S HOSPITAL SHEFFIELD
(110 Beds—Three Residents)

Applications are invited for the following posts vacant August 1st

HOUSE PHYSICIAN HOUSE SURGEON

The appointments are for six months with salary in each case at the rate of £100 per annum with board residence and laundry

Candidates (male and unmarried) who must possess registered qualifications, should forward applications stating age nationality, etc, together with copies of three recent testimonials to the undersigned

T. H. G. CARTLAND, Secretary

JENNY LIND HOSPITAL FOR CHILDREN, NORWICH

Applications are invited for the post of RESIDENT MEDICAL OFFICER Salary £120 per annum, with board, residence and laundry Candidates (male or female) who must possess registered qualifications should forward applications stating age nationality etc., together with copies of testimonials to the undersigned not later than first post on Tuesday, June 20th

FRANK INCH
June 9th 1933 Secretary

SANATORIUM, BRIDGE OF WEIR.

COLONY FOR EPILEPTICS, BRIDGE OF WEIR

ASSISTANT MALE RESIDENT MEDICAL OFFICER wanted to commence duties in August Keen evangelical and keen research worker preferred Appointment for six months in first instance, at rate of £200 p.a. (renewable by mutual agreement) with board and laundry Applications to Medical Superintendent stating age experience and qualifications and enclosing references

---

ROYAL ISLE OF WIGHT COUNTY HOSPITAL, RYDE I.W.

RESIDENT HOUSE SURGEON wanted for married single handed qualified and registered Salary at the rate of £180 yearly with board residence, and laundry Apply enclosing copies of testimonials, to Secretary before Tuesday June 20th Third-class return railway fare for selected candidates.

A. S. GORDON Secretary

ROYAL INFIRMARY, WIGAN
(180 Beds)

HOUSE SURGEON (male) required July 1st for a period of six months Salary £150 per annum with board apartments and washing Staff consists of R.S.O. and three House Surgeons Applications stating age and qualifications with copies of three recent testimonials should be addressed to the undersigned as soon as possible

A. STANLEY BRUNT
June 6th 1933 Gen. Supt. & Sec.

MANCHESTER ROYAL EYE HOSPITAL

Vacancy occurs at once for JUNIOR HOUSE SURGEON Salary £120 per annum with board etc Applications (with copies of testimonials) endorsed House Surgeon to be forwarded to the Chairman of the Board of Management by June 17th

H. R. NORTH
General Superintendent & Secretary

VICTORIA HOSPITAL BLACKPOOL

HOUSE SURGEON OR PHYSICIAN (Male).

Applications are invited for the above post from duly qualified and registered Medical Practitioners

The appointment is for six months from July 1st with salary at the rate of £200 per annum including board lodging and laundry The duties will include the giving of a certain number of anaesthetics The person appointed if satisfactory, will be eligible for the post of House Surgeon for a further period of six months Salary at the rate of £250 per annum

Applications stating age nationality qualifications and experience together with not more than three recent testimonials should be sent to the Hon Secretary endorsed House Surgeon or Physician on or before June 19th

Victoria Hospital JOHN HACKING
Blackpool Hon. Secretary
June 6th 1933

DURHAM COUNTY MENTAL HOSPITAL

ASSISTANT MEDICAL OFFICER

The Visiting Committee invite applications from duly registered Medical Practitioners for the appointment of Assistant Medical Officer at the Mental Hospital Salary £350 per annum rising by annual increments of £25 to £400 per annum, together with board lodging laundry, and attendance valued at £135 per annum plus £50 per annum for the Diploma in Psychological Medicine The appointment will be subject to the conditions of the Asylums Officers Superannuation Act 1909 and the successful candidate will be required to pass a medical examination Preference given to applicants with knowledge of Laboratory routine Applications with copies of three recent testimonials to be forwarded to the Medical Superintendent Winterton Stockton-on-Tees by June 21st

---

NATIONAL HOSPITAL FOR DISEASES OF THE HEART, Westmoreland St., W.1

PHYSICIAN TO OUT-PATIENTS

The Committee of Management invites applications for the post of Physician to Out-patients

Candidates must be Graduates in Medicine of a University of the British Empire recognised by the Royal College of Physicians of London and Fellows or Members of that College

Applications with ten copies of not more than three recent testimonials should be sent to me not later than Friday June 16th

ROBERT G. E. WHITBY
Secretary

NORTH ORMESBY HOSPITAL, MIDDLESBROUGH

HOUSE PHYSICIAN required male and unmarried Salary £120 per annum with board residence, and laundry There are three Students and the successful candidate will be eligible for the post of House Surgeon in due course

Applications stating age qualifications previous experience (if any) with copies of three recent testimonials, should be sent to the undersigned at once

GEORGE WATTS
June 6th 1933 Secretary Supt.

PRINCESS ELIZABETH OF YORK HOSPITAL FOR CHILDREN Shadwell Lond on E.1

HOUSE SURGEON required Salary at the rate of £125 per annum with board residence and laundry The appointment is for six months from July 1st Application stating age nationality, qualifications and experience accompanied by copies of not more than three recent testimonials should reach the undersigned not later than June 19th

T. F. RUSSELL Secretary

EDINBURGH MUNICIPAL HOSPITALS

There will be a vacancy for a RESIDENT HOUSE PHYSICIAN (male) at the Royal General Hospital Seafield Street Leith for a period of three months from July 1 (with possibility of extension) Salary at rate of £100 per annum (subject to temporary cut of 4½ per cent) plus board etc

Applications and testimonials to be sent as soon as possible to the Medical Officer of Health Johnston Terrace Edinburgh

---

SOUTHEND-ON-SEA GENERAL HOSPITAL
(228 Beds—Six Residents)

Wanted CASUALTY OFFICER duties to commence July 1st or as early as possible thereafter in England essential to commence not later than period ending Nov 1st 1933 Salary £150 per annum rising to £175 per annum from 1934 Salary £150 per annum rising to £175 per annum from 1934 Application stating age residence laundry Applications from British male candidates only stating age qualifications and experience with three recent testimonials, to the Joint Secretaries by June 14th

lesions often prove obdurate to treatment The extent of the usefulness of iron in this disease and in others in which this association is found is therefore being investigated

WATER EXCRETION AS A MEASURE OF EQUILIBRIUM WITH ENVIRONMENT

BY

D N PARFITT, M D LOND, B SC WALES, D P M

SENIOR ASSISTANT MEDICAL OFFICER, WARWICK COUNTY MENTAL HOSPITAL

The use of biochemical formulae as a measure of the emotional tension in psychotic patients has been advocated by McCowan and Quastel,[1] who suggest that the results of blood sugar curves can be used in the formula—

$$\frac{\text{2 hour blood sugar level minus the fasting level}}{\text{The highest blood sugar level minus the fasting level}} \times 100$$

and that the product in manic-depressive psychoses is in numerical proportion to the degree of emotional tension present The product is known as the hyperglycaemic index Their results have been supported and correlated by Lockwood[2 3] in studies of the psycho-galvanic reflex and of the blood cholesterol levels It is the purpose of this communication to show that the degree of emotional tension or, as it is here called, the measure of equilibrium with environment, can be equally well decided by a water excretion test based on that described by Beaumont and Dodds[4] as used by Strauss Graunwald A table showing the relation between the results of water excretion tests and the hyperglycaemic index in fourteen patients is included

That the renal water excretion is a sensitive index of renal function is well known, but it is so easily affected by nervous influences that its value as an ordinary clinical test is impaired Addis and Watanabe[5] have pointed out the variable water excretion from hour to hour and day to day in normal subjects on a constant water intake, while Goodall and Scholberg[6] have remarked on the low urinary excretion figures shown by many psychotics

For the water excretion test as used in this investigation the patient is completely starved from 5 p m to 4 a m, when the bladder is emptied During the next fifteen minutes one pint of water is drunk and the total quantity of urine excreted by 7 a m is measured, catheterization being resorted to where necessary A normal person excretes one pint of urine during this period, perhaps more, but oftener something less Since renal function is less active by night than by day, it must be noticed that bedtime for patients here considered is 7 p m, and that the ordinary ward work commences at 5 a m Occasionally the test was performed from 9 a m to midday after a night's starvation, but no great differences were observed following the change of time The following results were obtained

In sixteen patients with melancholia the average water excretion obtained was 5 ounces during the first month after admission, whereas when convalescence had set in the average was 14 ounces The increase in these patients was slow and the average time taken to approach normal figures was eight months In simple uncomplicated depression with retardation the average rise in the excretion figure in six months was from 13 to 21 ounces while two cases of depression without retardation or agitation whose only fear after six months was that they might be sent home, gave increased readings from 15 to 17 ounces

Similarly, early manias averaged excretions of 4 ounces those ill after two months 6 ounces, those convalescent after this time 12 ounces, and recovered cases 23 ounces

These figures contrast strikingly with the excretion rates in three placid imbeciles and four simple senile cases In the former the average excretion in the first week was 13 ounces, and after three months it was 15 ounces while in the latter a decrease from 15 ounces to 14 ounces was shown in six months These seven patients were equally at home in any environment if not ill treated

The following table (Table I) illustrates a series of sugar curves and water excretion tests obtained from fourteen patients

TABLE I

Case	Day after Admission	Sugar Level's in Mg % Fasting	2 hourly	Highest	H I	Water Test	Duration of Illness	Diagnosis	Clinical Measure of Emotional Tension†

H I = Hyperglycaemic Index of McCowan and Quastel
* These results were obtained between 9 a m and midday
† = Rough measure of emotional tension as observed clinically where ++ = well marked + = present and − = absent

There is a fairly general agreement between the two tests Case 1 in this table illustrates the value of the estimations This patient made two attempts at suicide

on the two days prior to admission the first by drowning and the second by gas Clinically she appeared to improve rapidly but suicidal patients are often very deceptive Because of the satisfactory results obtained from the sugar curve and the water excretion tests however she was discharged twenty six days after admission without ill result

As a measure of equilibrium with environment though not of cure in any particular case the water excretion test is also of use in other psychoses Thus in eight schizophrenics and non systematized delusional insanities the average excretion between the third and seventh days was 7 ounces After three months in those still solitary and unoccupied the average was 9 ounces while in those engaging in occupations it was 19 ounces The talkative self sufficient paranoid types were the first to show normal excretion figures

Four cases of puerperal insanity showed an average excretion of 4 ounces between the third and twelfth days In those unimproved after one month the average was 3 ounces while cured cases averaged 22 ounces

Seven senile paranoid patients with fairly well preserved personalities showed an increased excretion from 6 to 17 ounces in two months at which time they were becoming rapidly adapted to their new surroundings and engaged in light occupations

In an endeavour to ascertain the cause of these results an agitated melancholic patient was kept on a strictly fluid diet for ten days the total intake of fluids and the time at which taken were charted together with the amount of urine passed and the time at which it was voided In Table II the result is shown days being divided into quarters of six hours each

TABLE II

(The fluid intake in successive periods of six hours is shown in lines marked A while the urinary excretion is shown in lines marked B. The amounts are given in ounces.)

A		—	30	13	10	—	20	30	10	—	30	10	8	—	20	30	10	—	30	15	10
B	...	10	—	20	2	6	8	10	—	5	20	20	—	10	10	10	—	22	—	10	—
A	...	—	20	30	10	—	30	10	10	—	40	20	10	—	35	15	20	—	50	20	20
B		16	4	10	—	15	12	10	—	12	10	17	10	13	1	8	—	12	6	23	—

During the ten days 641 ounces of fluid were taken and 946 ounces of urine were passed a little over half the fluid intake Study of Table II shows that a corresponding half volume of urine is passed roughly six hours after the fluid intake Thus during this period a water test was performed the water being given at 9 a m At midday a total of 4 ounces had been excreted but at 2 30 p m 10 ounces more urine were passed It would seem then that there is a delay in water excretion in states of emotional tension and that this is the partial explanation of the results recorded

CONCLUSIONS

1 A water excretion test for the measure of equilibrium with environment is described and a comparison with the hyperglycaemic index is made

2 It is suggested that the results obtained are due to the delay in water excretion in states of emotional tension

I wish to thank Dr A T W Forrester medical superintendent Warwick County Mental Hospital for permission to publish this article

MEDICAL, SURGICAL, OBSTETRICAL

EMBOLISM OF THE ABDOMINAL AORTA ASSOCIATED WITH AURICULAR FIBRILLATION

Mr A H Winchester's and Mr A J Hawes's accounts in the *British Medical Journal* of February 18th and April 15th respectively induce me to record the following recent case

The patient F G aged 53 years was admitted to hospital on March 20th 1933 complaining of difficulty in breathing He did not look seriously ill but his radial pulse and cardiac action showed an irregular irregularity suggesting auricular fibrillation Brachial blood pressure 120/80 mm Hg He had been under treatment in 1931 with attacks resembling angina pectoris his brachial blood pressure at that time was always somewhat low varying between 95/50 and 105/80 mm Hg His blood serum gave negative Wassermann and Meinicke reactions He said that during the earlier part of the great war he had been in hospital with severe rheumatism for six weeks He had been formerly a great smoker

On the morning of March 22nd he was suddenly seized with severe pain in the left lower limb The whole left lower limb became pale and there was some mottling in the thigh no pulsation could be felt in the foot or at the groin and no oscillometric movement could be obtained in the calf or thigh In the right lower limb however though I could feel no pulsation in the arteria dorsalis pedis there was some definite pulsation in the femoral artery at the groin and slight oscillometric movement could be obtained—scarcely 1/2 at the calf and 1 in the thigh There was no pain complained of in that limb An embolus lodged at the bifurcation of the aorta was diagnosed

Dry gangrene of almost the whole of the left lower limb followed On April 15th the patient complained of pain in the right leg and no pulsation could be felt in the right femoral artery at the groin A few days later there was cyanotic discoloration of the right foot which however did not become actually gangrenous before the patient's death on May 15th

The necropsy showed sclerosis of coronary arteries aorta and iliac arteries There was ante mortem thrombus in the right and left auricles and in both ventricles An embolus had been arrested (riding) at the bifurcation of the abdominal aorta the right common iliac artery had not been completely blocked but there was occlusion of the right popliteal artery There were likewise embolic infarcts in the lungs kidneys and spleen

HAEMOGLOBINOMETERS AND HOW TO CHECK THEM

Every clinical pathologist in his routine work does a large number of normal blood counts sent him because pallor is mistaken for anaemia I noticed in 1922 working among war pensioners that at Hb 100 the red cell count was nearer 6 than 5 millions per cubic millimetre Whence then springs the legend that at Hb 100 the red cell count ought to be 5 millions per cubic millimetre? It is I think because (1) the expression 50 000 Hb R is easy to evaluate and because (2) haemoglobinometers lose their tint so that isolated readings are liable to be too high

The haemoglobinometer ought to be checked on receipt from the manufacturers and from time to time during use Those who work among children have early warning that a standard is losing its tint when they get readings of 90 and over since such readings are seldom found in children apart from polycythaemia—heart lesions for example But with adults there is no such warning nor when the Hb appears to be over 100 is in general any surprise felt

I set myself in 1927 the problem Does any—and if so what—relation exist between the Hb percentage and

APPOINTMENTS.—Important Notice.

Medical practitioners are requested not to apply for any appointment referred to in the following table without having first communicated with the Medical Secretary of the British Medical Association, B.M.A. House, Tavistock Square, W.C.1 (in the case of Scottish appointments with the Scottish Medical Secretary, 7 Drumsheugh Gardens, Edinburgh).

June 7th, 1933 By Order of the Council G. C. ANDERSON, Medical Secretary.

WEST LONDON HOSPITAL, Hammersmith Road, W.6. (234 Beds.)

Required ONE HOUSE PHYSICIAN, TWO HOUSE SURGEONS and ONE RESIDENT ANÆSTHETIST (Males). The duties of the House Physician include some work in the Neurological and Dermatological Departments. The duties of one House Surgeon include some work in the Genito-Urinary Department and of the other some work in the Gynæcological Department. These four appointments are tenable for six months from July 1st next, subject to one month's notice on either side. Salary at the rate of £100 per annum with board, lodgings and laundry allowance.

Candidates must be registered under the Medical Act. Applications (which must be on printed forms obtained from me) must reach me not later than first post on Friday, June 16th. Selected candidates will be required to call upon such members of the Medical Staff as directed to be in attendance at the Medical Council Meeting on Friday, June 23rd, at 4.30 p.m. and the House Committee Meeting at 5 p.m. the same day when the appointment will be made.

H. V. MADGE, Secretary.

THE WILLESDEN GENERAL HOSPITAL, N.W.10.

Applications are invited from fully qualified and registered candidates (unmarried) for the appointment of a Resident Officer to hold the appointment of CASUALTY OFFICER for three months from July 1st, followed by a six months' appointment as HOUSE SURGEON (total nine months).

Salary at the rate of £100 per annum.

Applications to be received by the Secretary not later than first post Saturday, June 17th.

THE HOSPITAL FOR SICK CHILDREN, Great Ormond St., London, W.C.1.

Applications are invited from registered Medical Practitioners for the following non-resident appointments which become vacant on July 1st:—

A CASUALTY MEDICAL OFFICER (male). Salary £250 p.a. (half-time).

TWO OUT-PATIENT MEDICAL REGISTRARS (male). Salary £250 p.a. (half-time).

THREE OUT-PATIENT ANÆSTHETISTS. Honorarium £50 p.a. (part-time).

Also for an IN-PATIENT MEDICAL REGISTRAR (male). Salary £300 p.a. (whole-time).

Duties to commence on October 1st.

All the above appointments are tenable for twelve months but are renewable.

Candidates must be prepared to attend for interview at the Hospital on Wednesday, June 21st, at 4.45 p.m.

Applications supported by not more than three testimonials given especially for this purpose must be submitted to the undersigned not later than Saturday, June 17th, from whom further particulars and forms of application may be obtained.

H. F. RUTHERFORD, Secretary.

THE ROYAL EYE AND EAR HOSPITAL, BRADFORD.

Wanted JUNIOR HOUSE SURGEON (male). Salary £150 with board, residence and laundry.

Application stating qualifications and etc. with copies of recent testimonials to be forwarded to the undersigned on or before June 14th.

F. BRIGGS, Secretary, Sup.

HULL ROYAL INFIRMARY. (350 Beds.)

Applications are invited from registered Medical Practitioners for the post of THIRD HOUSE SURGEON (male), vacant June 25th.

Salary at the rate of £150 per annum, plus residence, board and laundry.

The candidate appointed will be expected to stay for not less than six months, but the appointment is at any time determinable by one month's notice on either side.

The Hospital is recognised by the Royal Colleges for the F.R.C.S. examinations.

Applications giving particulars of age, experience and nationality, together with copies of testimonials, should be addressed to the undersigned.

P. J. CAPLESS, House Governor.

May 29th, 1933.

SEAMEN'S HOSPITAL SOCIETY.

KING GEORGE'S SANATORIUM FOR SAILORS, LIPHOOK, HANTS.
(For the Treatment of Pulmonary and Non-Pulmonary Tuberculosis.)

ASSISTANT MEDICAL OFFICER required, as from July 1st. Salary at the rate of £200 per annum, with quarters and board. The appointment is for six months in the first instance. There is no accommodation for a married man. Application, with not more than three recent testimonials, to be sent in by Tuesday, June 13th to the undersigned.

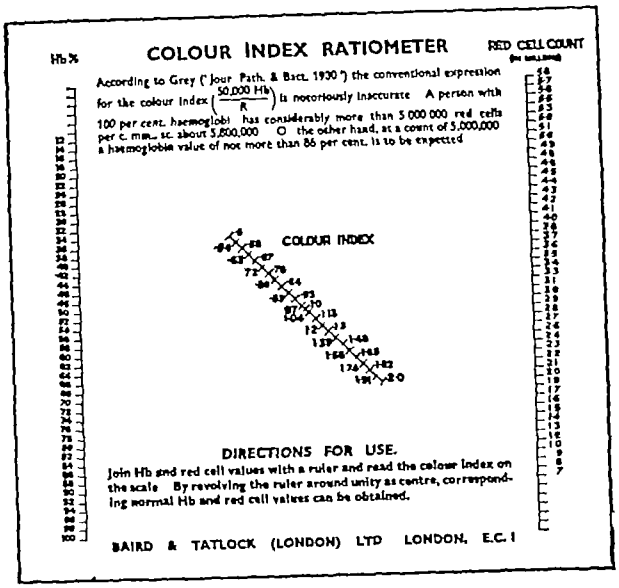
Seamen's Hospital, R. E. V. BAX,
Greenwich, S.E.10. Secretary.

May 25th, 1933.

(Appointments continued on p. 47.)

the red cell count in normal blood? After examining a large number of counts on men, women and children, I came to the conclusion that this was a constant, and was able to confirm the suspicion held by many that the conventional expression for the evaluation of the colour index was wrong and propounded in 1930[1] the expression 58 000 Hb/R, observing at the same time that the ratio Hb/R was a constant in normal blood, and that the theoretical haemoglobin value might be calculated by multiplying the red cell count in millions by 17 (or more accurately by 17 24)

The true colour index may be read from the following chart (obtainable from Messrs Baird and Tatlock)



The application of these data to the checking of haemoglobinometers is obvious Suppose your assistant's red cell count at any given moment is 5 2 millions per cubic millimetre This if I am right, corresponds to Hb 90 Lake and gas 20 c mm of the blood in the usual manner and dilute to the 90 mark (1 8 c cm) If then your standard differs sensibly from this temporary standard, you must either get a fresh standard or apply a correction

It must not be forgotten that the specific gravity of the blood (and in consequence the red cell count and Hb, and indeed all other constituents of the blood) varies from day to day and hour to hour, so that it is useless to attempt to check a haemoglobinometer except by a red cell count and haemoglobin estimation done then and there

London TEMPLE GREY, M B, Ch M

AN UNUSUAL CASE OF PERFORATION OF THE APPENDIX

About the middle of January I was consulted by a girl, aged 17, on account of abdominal pain which had existed for three weeks previously There was no previous history of abdominal pain, and no history of biliousness or of cyclical vomiting The pain, which was at no time severe, was referred to both iliac fossae, but mainly to the right No increase in pulse rate nor elevation of temperature was recorded during the time she was under observation, although an ill-defined swelling could be felt in the right iliac fossa No real resistance existed, and the abdomen moved well on respiration

A diagnosis of 'grumbling appendix" was made and on February 23rd appendicectomy was carried out through a Battle's incision A retrocaecal appendix was found with but little evidence of recent inflammation Lying between the two layers of the meso-appendix was a typical blackish concretion, about the size of a cherry-stone, over the surface of which the two layers of the meso-appendix could be freely moved On slitting open the appendix after removal no evidence of the passage of the stone could be detected in fact the organ was inclined to be fibrotic The clinical course at no time suggested that a perforation had occurred, no doubt owing to the fact that the stone had found its way into the interstitial tissue, leaving the peritoneum intact

Such an event would appear to be as rare as it was fortunate for the patient

EXPERIMENTAL PRODUCTION OF MALIGNANT TUMOURS

DISCUSSION AT THE ROYAL SOCIETY

A discussion meeting took place at the Royal Society on June 15th, with the president Sir F GOWLAND HOPKINS in the chair, the subject was the experimental production of tumours

Dr J A MURRAY, F R S, in opening said that the investigations of the last thirty years had proved that under appropriate conditions, the cells of the higher vertebrates were capable of unlimited proliferation Nothing was commoner in the literature of cancer than loose statements that this or that agent conferred on the cells powers of unlimited new growth, which was non sense, seeing they already possessed such powers The essential feature was the uncontrolled or autonomous character of the cellular proliferation—that is to say, the agencies which were effective in the body in limiting the rate and amount of growth and cell division were in effective against true new growths This applied to growths both benign and malignant Examples were seen in the fatty tumours, lipomata, which went on increasing in size in an emaciated individual, and the uterine myomata, which grew progressively even after the menopause The malignant new growths, carcinoma and sarcoma, exhibited this proliferation still more clearly, showing often a more rapid rate of growth The other distinctive features of the malignant as contrasted with the benign new growths were differences in degree rather than in kind, and their more perfect independence or autonomy manifested itself in infiltrative progress dis organizing and destroying the normal tissues by pressure from without or occlusion and rupture of blood supply The stretching and tearing of the walls of blood and lymph vessels opened the way for the entrance of aggregates of parenchyma cells into the vessels, and these, transferred to remote situations, formed secondary centres of growth or metastases It was these manifestations of neoplasia which rendered cancer so formidable a problem in treatment The new proliferative conditions arose in limited localized foci, and once they had reached a size sufficient for recognition further increase took place only from the descendants of the already transformed cells, without fresh accessions from the surrounding elements of the same kind One type of cell by its multiplication gave rise to the new formation, so that it was usually possible by microscopical examination to infer the tissue of origin, even after the tumour had reached a great size Dr Murray went on to say that these ideas and conclusions had obtained a welcome precision and validity from the study of the transplanted malignant new growths of the mouse and rat In consequence, it was now possible to define new growths with some confidence, as single-tissue proliferations arising in a localized area, growing from their own resources in an uncontrolled manner, and showing a continuous graduated series in those arising from any one tissue, both in histological structure and in rate and habit of growth He discussed the various attempted solutions of the problem of the nature and causation of malignant new growths There was first of all, the genetical hypothesis originating with Boveri, and modified by Bauer, the main objection to which now was the necessity of assuming a large number of constituent units in each gene, to allow for the great number of slight modifications present d by the new growths of any one tissue, all practically

permanent There was next the virus hypothesis particularly associated with the names of Borrel Rous and Gye Gye's genial conception of a factor derived from the host cells and carrying all the specific distinctive characters of the tumour strain acting in conjunction with a relatively non specific virus was still without direct experimental proof Like the enzyme modification the greatest obstacle to its acceptance was the failure to demonstrate cell free transmission in the laboratory strains of mouse and rat tumours Finally there was the special form of the chronic irritation theory of Virchow which had arisen on the basis of the work of Yamagiwa on the experimental production of tar cancer The experimental confirmation of Virchow's theory had established its validity as a concise description of the emergence of cancer after prolonged localized slight irritation of the tissues by a variety of agents and nothing more Wide differences of opinion still existed as to how this result was brought about Dr Murray said that in his opinion the chemical and physical carcinogenic agents acted indirectly they set up such conditions in the tissues that as a new departure here and there cancerous foci were started The chemical properties of these agents gave no indication of how the autonomous uncontrolled type of proliferation was induced indeed they were so varied that it was difficult to see how they could give any definite indication of the nature of the cellular mechanism involved In conclusion Dr Murray said that it was clear that the experimental induction of malignant growth reproduced perfectly the phenomena which occurred in the development of occupational cancer from exposure to tar or x rays for example The other forms of cancer for which no definite irritant could be identified at present were so similar in their mode of occurrence and the length of time necessary for their appearance that it was reasonable to accept the facts of experimental carcinogenesis as a model of the genesis of the others also An attempt had been made to indicate directions in which difficulties still remained The definition of those difficulties and the material and methods by which they were being attacked were due to the modern development of experimental carcinogenesis

Dr J W COOK discussed certain results obtained at the Cancer Hospital by his colleagues and himself He regarded the term chronic irritation as an entirely inadequate description of the effect of applying a carcinogenic substance to animal tissue There were many examples of industrial diseases brought about by chemical irritation but few of them led to malignant tumours Many constituents of coal tar were powerful irritants yet were entirely without result in experimental carcinogenesis The most powerful carcinogenic compound yet obtained was benzpyrene which had recently been isolated from coal tar He described experiments with this and related substances particularly benzanthracene which had very definite cancer properties and gave tumours in a large proportion of the animals treated It seemed clear from a study of the chemistry of these substances that the property of cancer production was a constituent one depending on the type of molecular arrangement

Dr W CRAMER agreed with Dr Murray that growth was a phenomenon taking place in the tissues of the body and integrated to the needs of the organism being subject to inhibitions and stimulations Malignancy was the negation of that integration Here the condition progressed when the stimulus ceased The malignant cell was no longer subject to the stimuli or inhibitions which controlled normal cells If one took a normal tissue and inoculated it from one animal to another of the same species a connective tissue reaction resulted which led eventually to the disappearance and absorption of the inoculated transplant Malignant cells elicited in the host a connective tissue reaction which by providing a stroma enabled them to establish themselves in the next host so as to form a tumour Sometimes the connective tissue regained its dominance and invaded the tumour which disappeared This occurred in the rare cases of spontaneous absorption and was also the basis of the disappearance of tumours by radium There were many different types of malignancy all of which bred true suggesting that the cellular changes resided in the nucleus the cell organ mostly responsible for inheritance It also indicated that malignancy was not cell anarchy The life and behaviour of a malignant cell was not lawless but governed by laws as strict as those governing normal cells The phenomena of carcinogenesis presented two problems the nature of the cellular change responsible for the behaviour of the malignant cell and the manner in which this change was brought about The first of these problems was still a matter of speculation and dispute the second was solved so far as essential features were concerned Cancer could be produced experimentally at will Excepting tuberculosis syphilis and vaccinia which were caused by a specific organism there were very few diseases which could be produced experimentally and none in which the experimental production in animals simulated the natural disease as completely as in cancer The period required to produce cancer when measured in actual time was very much shorter in the mouse (four to six months) than in man (ten to fifteen years) but when measured in biological time as a fraction of the normal span of life it was almost identical A long period of induction was necessary whatever agent was used and might be regarded as an essential feature of the process of carcinogenesis Experimental carcinogenesis gave no support to the view that there was a greater tendency of the senile tissues to undergo malignant transformation to produce cancer experimentally in the aged animal was if anything more difficult than in the young The age incidence of cancer must be due to the fact that the conditions which induced spontaneous cancer required a considerable fraction of the span of life in order to produce a malignant transformation Referring to the induction of carcinogenesis experimentally by the so-called filterable virus of fowls Dr Cramer said that the immunological work of Gye and Purdy and of Andrewes furnished convincing evidence to his mind that the agent responsible for the transmission of these tumours contained an element which was not of fowl origin—in other words a virus With regard to the nature of the change in the cell which constituted malignancy he felt that those who so confidently denied the possibility of a virus being responsible for malignancy took a somewhat narrow view The existence of viruses was known only in so far as they were pathogenic but just as there were non pathogenic bacteria there might be non pathogenic viruses Their presence could not be recognized because they could not be seen and they did not produce a disease Since they were supposed to be living matter they might produce chemical reactions without themselves being used up in those reactions If so they would simulate the behaviour of ferments and since most viruses could only live and multiply in living cells their presence would be masked by the activity of the cells In conclusion Dr Cramer said that there was a curious tendency even in the medical profession to surround cancer with a mystery and the most foolish statements got a hearing if they were sufficiently sensational He saw no more mystery in cancer than in any other manifestations of cell life Cancer began as a local disease it could then be cured and was being cured in a high percentage of cases in those sites where it could be diagnosed most readily It was seen that in the great majority of organs and tissues cancer was due to some extraneous factor setting up a condition of chronic irritation If there were such extraneous factors it must be possible to avoid them on learning what they were and cancer would then be a preventable disease

Dr C H ANDREWES found it very difficult to believe that fowl sarcomas were essentially a different type of tumour from mammalian sarcomas and he did not think it possible to maintain the attitude that these filterable fowl tumours afforded an example of a peculiar disease in fowls quite apart from fowl tumours as a whole Whenever a fowl sarcoma had been studied over a reasonable period—a year or two—the tumour was sooner or later found to be filterable He proceeded to show how serological evidence supported the view that the agents were viruses Dr Murray had suggested that many people fought shy of a virus theory of cancer because it would be necessary to postulate the existence of an inordinate number of viruses producing all sorts of histological types all through the animal kingdom But he

15 PRIVATE MENTAL HOME (FOR LADIES ONLY)—EXCEPtionally nice house and grounds A considerable sum required for the purchase Further particulars on application

bacteriologist, aware of the wayward habits of bacteria, was not very much surprised at finding that sort of thing, because many bacteria had specific antigens which were peculiar to themselves, and group antigens which were common to a number of species It must be taken as the unsatisfying conclusion that these different tumour viruses were neither identical serologically nor yet wholly distinct There was something in them which was individual, and something which was shared by a number, and according to one's private tastes in the making of theories one might gloss over the common element and stress the specific, or vice versa He was hopeful that in course of time complement fixation, agglutination, and other reactions would be applicable to the study of fowl tumours, and thus there was a considerable field in which it might be possible to relate all the intermediate conditions between true tumours and infections and to throw light on the really vital problem of the relation between avian and mammalian new growths

Dr P R PEACOCK said that it was now recognized that the filterable avian tumours and their relation to mammalian tumours constituted a problem which must be solved before generalizations as to the cause of tumours could be regarded as more than interesting speculations About four years ago he had set about producing tumours with recognized carcinogenic samples of tar injected intramuscularly into fowls, and he found no real difficulty in producing tumours, provided the birds could be kept alive from six months to a year He gave a general account of these experiments, and added that there could be no doubt, with regard to the mode of producing these tumours, that the growths in the fowl were exactly comparable to growths in mammals produced by similar means

Dr J MCINTOSH laid before the meeting the outcome of some experiments on the virus theory of cancer To determine the relation of the Rous sarcoma to the ordinary mammalian tumours, he had taken a series of fowls and injected tar diluted in lard Tumours of one type or another were found in just over half the birds treated with the tar Microscopically the tumours varied considerably in character some being fibrosarcomatous and others definitely leucosarcomatous, with numerous intermediate grades Others were predominantly endotheliomatous and angio-endotheliomatous More curious was the tendency to obtain mixed or pleomorphic tumours associated with leukaemia He offered three explanations of the experimental findings The occurrence of a filterable leukaemia and a filterable Rous type of tumour suggested that the action of a virus must be taken into account It would seem that the tar injections in some manner, by stimulating cell proliferation, allowed the virus to get a hold on the young cells and come into evidence as a leukaemia or sarcoma Again, it might be that the proliferative and tumour-like effects were due to one single pleomorphic virus with an affinity for any tissue of mesoblastic origin Thus at one time the result of its action might be a leukaemia, at another a fibrosarcoma, and at another an endothelioma The third and perhaps simplest explanation of pleomorphism was the acceptance of the specific factor of Gye, this specific factor, being derived from the tissues themselves and thus linked with the common virus of the fowl, determined the type of tissue proliferation

Dr W E GYE said that one important point had not been touched upon in the discussion It concerned work done largely by Murphy—though, he thought he could say started by himself—on the inhibitory factor in fowl tumours The Rous sarcoma grew at a great rate normally, but from time to time it entered upon a benign stage, when growth was very slow How was one to explain this great variation in the rate of growth, and the corresponding clinical and pathological appearances? The observation had been made that the slow-growing tumours contained some inhibitory substance, and Murphy apparently had devised a technique whereby some constant results in this direction were obtained The tumour cell in this stage apparently responded to the presence of the virus by producing something which checked or restrained the activity of the virus itself

Professor A E BOYCOTT could not see that the three hypotheses which Dr Murray had brought forward for the cause of cancer were alternatives in the sense he used them, they seemed to him to be rather complementary to one another He agreed with Dr Cramer that the growth of tumours could not be described as lawless or anarchical, in the same way the criminal had his own code, and stuck to it The tumours maintained the characteristics of their type through successive generations of cells, different from the normal tissues among which they grew The problem was whether the carcinogenic agents acted directly on normal cells and produced the mutation, or all of them caused the tissues themselves to produce some particular carcinogenic substance Another view of the nature of these irritating substances was that they afforded a suitable nidus on which the supposed extraneous virus obtained a lodging He thought that the idea of an extraneous virus had little to be said for it It seemed unlikely that something capable of independent life—Dr Cramer had said that it was living matter—could endure the amount of 'knocking about," in the shape of precipitation, adsorption, resuspension and so on, which was inflicted on these agents, and still preserve its integrity

NIETZSCHE AND PSYCHOLOGY

At a meeting of the Medical Society of Individual Psychology on June 8th, with Dr H WOODCOCK in the chair, Dr F G CROOKSHANK read an abstract of a paper on individual psychology and Nietzsche Dr CROOKSHANK said that the psychological movement of the last thirty or forty years had its source in the Nietzschean revolt against the whole artificial structure of categories, classes, causes, and concepts set up in the nineteenth century upon a basis of mediaevalism This earlier psychology, founded upon the separation of human beings from one another in terms of differences, contrasted with the new psychology, which was based on the recognition of what we had in common with one another as men and women Much as Freud and Jung owed to Nietzsche, the bond between Nietzsche and Adler was particularly close Not only did both consider that purpose was the mainspring of action, but Nietzsche, in an early work, saw in the *will to power*—that fundamental of individual psychology—the motive force in all living *phenomena* The Nietzschean philosophy regarded pain as the greatest educator and ennobling force in Nature here was the germ of Adler's doctrine of the overcoming of weakness by courageous effort Again, Nietzsche, like Adler, emphasized the relation between physical ill-health and emotional feeling, especially resentment, and elsewhere he foreshadowed Adler's doctrine of compensation Not that all individual psychology was to be found, even in embryo in Nietzsche's writings Nor was individual psychology's debt to Nietzsche consciously incurred Nietzsche failed in his own life, partly because he carried his revolt of the individual to such a pitch that he, the superindividual, became mad as a result of self isolation Adler on the other hand, considered that the essence of sanity lay in the relation of the individual to the community and to that extent individual rights were subordinate to social rights Nietzsche glorified the strong for their strength, and despised the weak for their weakness In dividual psychology spelt encouragement for all weak and strong alike The paradox here was in keeping with individual psychology, which was itself a paradox from beginning to end Called individual psychology and rightly, it was nevertheless the first and best, if not the only, social psychology

Mr LUDOVICI remarked that certain factors separated Nietzsche definitely from Adler Nietzsche would have asked if it was necessary to allege that the *neuroses* resulted from a revolt against society His attack was against Plato and Socrates He fought against dualism, against the transvaluation of values which enabled men to excuse appearance Disease and abnormality were disfigurements Morality was largely a matter of taste Nowhere did Adler ask a question of this sort Nietzsche would ask, With whom were we to co-operate? Dr J C YOUNG pointed out that consideration of the

All communications to be addressed to Mr A. V. STOREY General Manager

Nietzschean philosophy was of value when dealing with the schools of Freud Adler and Jung Much that Nietzsche prophesied had come to pass Dr S VERE PEARSON said that forty five years had passed since the publication of Nietzsche's last work Nietzsche's attack was on the Christian church of his day It was now recognized that men were not equal—it was equality of opportunity that was required In Nietzsche's day this idea was not prevalent Dr A SANDISON agreed that psychology and philosophy were possibly matters of taste But it was not so so far as fundamental truths were concerned

Dr F G CROOKSHANK in reply said that though Adler differed in some respects from Nietzsche yet always he continued his line of thought Individual psychology worked pragmatically Adler's psychology was justified practically his patients got well Nietzsche opposed academic Christianity In individual psychology the question of taste did not arise

LEGAL PITFALLS OF THE SURGEON

Mr D HARCOURT KITCHIN read a paper on this subject at a post graduate course arranged by the Fellowship of Medicine at the Royal Albert Docks Hospital on June 11th He pointed out that although the surgeon usually came to the law courts as respondent to a civil action he might find himself in the dock of a criminal court if he performed an illegal operation Most surgical procedures caused grievous bodily harm but the law assumed that the surgeon had good therapeutic grounds and that his theoretical offence was excusable Nevertheless an aggrieved patient might always prosecute thus requiring the surgeon to prove his therapeutic reasons Sterilization unless necessary for the health of the patient was likely to expose the surgeon to a criminal prosecution Similarly abortion was a felony and must not be performed without good therapeutic reason Any operation performed without consent of the patient might lead to a civil action against the surgeon unless he had operated in emergency on an unconscious patient with due skill and care and had done no more than was reasonable Most disputes about consent arose when the uterus or both ovaries had been removed from a woman the classical case being Beatty *v* Cullingworth Miss Beatty had said in the theatre If you find both ovaries diseased you must remove neither and Mr Cullingworth had replied You must really leave that to me The fact that she had then taken the anaesthetic led the jury to imply that consent had been given and she lost her case Mr Cullingworth had been perhaps rather lucky In the more recent case of Cull *v* the Royal Surrey Hospital and Butler the plaintiff's doctor had written to the hospital saying that she had decided not to undergo the hysterectomy recommended by Mr Butler She entered hospital for a simple curettage but the letter never reached Mr Butler and he removed the uterus He got off with a farthing damages because he could not possibly have known of the letter but the hospital had to pay £120 Mr Kitchin advised the surgeon to obtain written consent for the operation which he intended to do and to explain to the patient the possibilities involved in his procedure Oral consent could not be really safe nor was it desirable to obtain too comprehensive a permission for a jury might be much influenced in assessing damages if it felt that a surgeon had taken advantage of a *carte blanche*

NEGLIGENCE

Negligence in law was the breach of a duty to take reasonable care and use a reasonable degree of skill the interpretation of the word reasonable being a matter for the jury in each case The degree of skill varied with the circumstances a general practitioner being expected to have less than a specialist The pitfalls in this branch of the law were so numerous that they could hardly be counted and many of them could not be avoided by the most scrupulous care and the most exceptional skill In Tyndall *v* Allcock the surgeon had taken the most elaborate care and treated the little girl patient as if she were his own child The jury did not want to find him negligent but very much wanted to compensate the little girl for the deformity which would prevent her from continuing her study of the piano When the judge explained to them that they could not give compensation without finding Mr Allcock negligent they found him negligent and awarded £2 000 damages At appeal Lord Justice Scrutton remarked that a jury was seldom a suitable tribunal to try a case which involved right differentiation between an error of judgement and a departure from the required degree of skill Lord Justice Sankey however thought a jury more likely to come to the right conclusion than a committee of experts and Lord Justice Romer observed somewhat ironically that Mr Allcock must get such consolation as he could out of the fact that trial by jury was the foundation of his liberties Mishaps might be the result of some special sensitivity or idiosyncrasy in the patient In Murdock *v* Holmes and Taylor some anaesthetic had dropped into a patient's eye and he had lost the sight of it Evidence was given that the anaesthetic would not greatly damage a normal eye and that the patient had been in a highly toxic state The jury disagreed When possible it was advisable to test for sensitivity beforehand If a newly invented form of treatment was tried the surgeon should explain to the patient clearly what he intended to do and why and the extra risk it entailed If the method were carefully thought out and proceeded logically from scientific research he would be justified in using it Every medical man knew that the value of a radiograph might in practice be very small but in the law courts it was very high indeed To omit to take an *x* ray photograph of possible bony injury was in itself regarded as an act of negligence If the patient objected the surgeon should get the objection in writing or make a note of the refusal at the time

The surgeon might be held liable for the negligence of his assistants A long series of decisions had restricted his liability for other people's mistakes he was not responsible for the negligence of a nurse carrying out in his absence some task which it was quite proper to delegate to her but his responsibility for assistants at an operation had not been definitely settled In Hillyer *v* St. Bartholomew's Hospital Lord Justice Farwell had expressed the opinion that a surgeon was in supreme command of his team as soon as the doors of the operating theatre had closed Since the point at issue was the liability of the hospital governors and not that of the surgeon these remarks could only be regarded as *obiter dicta* they had never been tested in a case It was practically certain that a surgeon could never be held liable for the mistake of an anaesthetist unless he had reason to doubt his competence The assistant surgeon the theatre sister and other members of the team were also highly skilled people doing their respective jobs but at any stage the surgeon might say to any one of them You are doing that wrong To that extent the law might say that he had control of them and was therefore responsible for their misdoings In practice however his own job required a very high degree of concentration and in the interests of the patient he could spare little time for supervision of others It was the custom for example for the theatre sister to count the swabs and instruments before and after the operation and for the surgeon to take her word that nothing had been left in the patient's body The law was not certain whether to free him from responsibility for the count or not In South Africa the case of Van Wyk *v* Lewis had made it a settled rule of law that the surgeon might rely on her but this case did not bind English courts and the Lord Chief Justice in Crotch *v* Wiles had suggested that the jury might think that a surgeon should count the instruments himself when the operation was completed Some surgeons suggested that all swabs should be made opaque to *x* rays so that she could at any rate be located before the patient left hospital others thought a human count was inevitably unreliable and they relied on long tapes attached to even the smallest swab Finally Mr Kitchin pointed out that most actions brought against surgeons were based on flimsy pretexts and urged every surgeon to join a defence society

Reviews

ENGLISH DICTIONARIES

In his *Survey of English Dictionaries*[1] Mr M M MATHEWS of Cambridge, Massachusetts, provides a great deal of information in a small space We are too apt to look back to Samuel Johnson's great work as the beginning of English lexicography, but a very cursory reference to Mr Mathews's book shows our error Dictionaries, as he has pointed out, began with collection of glosses, forming glossaries of hard words made by students of a foreign language, alive or dead English dictionaries began when the student first found lists of hard words in his own tongue useful or necessary The first English dictionary in our modern sense of the term was that of Robert Cawdrey, who in 1604 published his modest *Table Alphabetical* of about three thousand words From that time till the publication of Johnson's work in 1755 various dictionaries appeared, of which Henry Cockeram's, in 1623, was the first to bear the title of " The English Dictionary " As Mr Mathews says " As long as the vocabulary continues to grow—that is, as long as English continues to be a living language—new dictionaries will be necessary to record the ever-growing vocabulary " In the great *Oxford English Dictionary* half a million words are recorded, and in the five years which have passed since the appearance of its last part many thousands of words have been collected ready for insertion in a supplement Dictionaries have become so numerous that the time cannot be far distant when a ' dictionary of dictionaries " will be called for Mr Mathews foreshadows such a publication in his interesting survey

To possess the recently published *Shorter Oxford English Dictionary*[2] in two volumes is the next best thing to owning the parent work There are any number of small dictionaries (of the size of the admirable *Concise Oxford*) on the book market which supply the modest reader with all he wants But dictionaries which bridge over the verbal gap between the small dictionary and the giant twelve-volumed *O E D* and which are also of proved excellence, are few and far between The dictionaries and those painstaking compilers of dictionaries—the lexicographers—are the guardians of the language They preserve it from corrupt spellings and loose extensions of meaning The fact that a dictionary of any size must by its nature lag behind the current usage of words is something to be not regretted but praised A word has to prove its worth before it attains its proud position as part of the language The editors of the *Shorter Oxford* have had the advantage of being able to incorporate in it new words and new meanings of words which have been collected for a Supplement (to the major work) of new words and phrases to appear in the autumn of this year The selection of these new words, the tactful separation of the " gate-crasher " from the bona fide guest must have been an arduous and invidious task for those who had to make the final decision Looking for these new words we note the omission of " gene," and of ' chromosome ' among the many scientific terms beginning with " chromo " There can be no doubt that this dictionary will be of untold value to those who need authoritative pronouncement on the right meanings of words, and who by reason of scanty shelf-space, smallness of purse or inaccessibility to libraries are unable to consult the greater dictionary To attempt such an abridgement, and—to use a vulgarism— to " get away with it," must have been a task almost as formidable as the preparation of the major work The editors are to be warmly congratulated on preserving those features of the original work which distinguished it from all other dictionaries as " the dictionary " It is in truth, at a moderate price, a quintessence of the vast material of the *O E D*

ANATOMY OF THE EYE AND ORBIT

Mr WOLFF's monograph on *The Anatomy of the Eye and Orbit*[3] is an addition of considerable value to ophthalmological literature In its range of subjects it is comprehensive, dealing seriatim with the bony orbit and accessory nasal sinuses, the eyeball itself, the appendages of the eye (lids, conjunctiva, and lachrymal apparatus), the extrinsic muscles of the eye, the nerves connected with it (motor, sensory, and involuntary), and the blood vessels, while the last two chapters describe the development of the eye and its comparative anatomy The description of the anatomy is classical—in places indeed too classical, when it tends to retain the older views without discussing their newer modifications For example, the corneal nerves are described (as if in man) in the classical way as distributing themselves in three plexuses—one in the substantia propria, one subepithelial and one intra-epithelial , the work of Attias and others is not mentioned, while a footnote draws attention to the fact that such a distribution has never been demonstrated in man Again, the newer radiographic work on the mechanism of the conduction of tears is inadequately noticed These, however, are small points of criticism in the main the book is a very sound and concise exposition of its subject

More interesting actually than the anatomical descriptions themselves are the constantly recurring notes on applied anatomy and points of clinical importance which follow from anatomical relationships These give an unusual interest to the text, and will help to impress anatomical facts upon the student's mind as no other method can Particularly is this so in the sections dealing with the nerves and their central connexions, wherein the bare presentation of a large array of anatomical data is relieved by short descriptions of the effects of lesions as interpreted from their topographical relationships Some typographic errors have crept in, such as the repeated spelling of Greeff with one " f," but on the whole the volume is extremely well presented, and the illustrations are of a high order Many of these are borrowed from classical sources, but the author has enriched the literature with many original drawings and microscopical sections of considerable value and artistic merit

The book is essentially for the senior student (it is too large for the junior one) , but it does not include sufficient detail nor is there a sufficiently exhaustive bibliography to serve for purposes of research or reference

well recognizes that definite answers in all sorts and conditions of patients cannot always be given that for instance longer and more elaborate treatment may be afforded by the patients of Rollier at Leysin than by the working classes who are treated on the prescription of the workmen's sick insurance funds and that consequently more radical surgical measures may have to be taken in the latter class of case—the choice having to be made between them and a grave risk of relapse The author puts forward as a typical example of the problems which come before the inquirer that of the relation (if any) between injury and tuberculosis of bones and joints The very widest divergence of views has been held by high authorities on this matter In Germany from an insurance point of view the question is important as also is the question of injury or infection in prescribing treatment To order massage and movement of a tuberculous joint may have very grave and evil consequences Opinion has changed from that of Volkmann and König who saw trauma as the cause of nearly all surgical tuberculosis to that of Limiger who admitted its occurrence in only 3 per cent of cases Since the first Accident Congress at Leipzig in 1922 opinion in Germany has been greatly strengthened in favour of the belief that a causal relation between injury and tubercle is extraordinarily rare The difficulty of an experimental investigation is however great Dr Flesch Thebesius describes attempts that have been made by various methods without very definite results The desirability of removing by operation tuberculous foci when they are easily accessible and when there is no mixed infection is reasonably maintained No doubt some extreme advocates of non interference go too far when they refuse to remove an enlarged but isolated gland but condemn the patient to months of restraint in expectation of resolution by means of the sun's or other rays The author offers some striking illustrations purporting to show bony ankylosis of tuberculous vertebrae This is so rare a phenomenon that care has to be taken to exclude other causes of osteomyelitis before making such a diagnosis The brochure is well illustrated though the author does not go into many details of treatment or describe splints or operations

A SURVEY OF RADIOLOGY

The 1932 Year Book of Radiology[1] by CHARLES A WATERS and IRA I KAPLAN serves as a landmark in the literature of this subject It is divided into two parts—one dealing with diagnosis and the other with treatment. An enormous amount of work has been done in abstracting radiological literature in all languages in sifting the wheat from the chaff and in presenting to radiologists a very concise and complete account of all important work which has appeared during the past fifteen years The authors felt that in this branch of medicine there was special need for a volume which would give an outline of progress in radiology and the articles reproduced have been chosen as representing a compact view of the whole subject uninfluenced by the personal opinions or ideas of the editors It is intended to serve as a reference book for the radiologist the research worker and the general practitioner of medicine All the systems of the body are surveyed and a very high standard is maintained throughout but the sections concerned with the osseous system and the gastro-intestinal tract deserve special commendation Special chapters deal with technique medico-legal matters teaching and instruction

Part II of the book is devoted to radiotherapeutics It deals with both *x* rays and radium therapy and does not attempt to separate these into watertight compartments—a method to be commended because in actual practice a combination of the two is frequently necessary In *x* ray therapy the maximum voltage in general use is about 200 kV but there are many who are desirous of using higher and higher voltages so as to produce *x* rays approximating to the gamma rays of radium The question whether short wave lengths show greater elective action is still unsolved but all these problems are fully discussed by the authors opinions of the leading writers on the subject being given An excellent chapter deals with general considerations in radiotherapeutics and special chapters are devoted to radiation biology the physics of radiation and the radiation treatment of various diseases The different methods of *x* ray therapy are outlined the newer methods being given in detail

The chapter on diseases of the blood is of special interest all the newer methods of treatment being described The results of Dale's method in the treatment of leukaemia are given and appear to be satisfactory Dale's method consists in irradiating almost the whole body with small doses of *x* rays from a distance of 1 metre It is claimed that by this means there is an avoidance of anaemia which may result from heavy applications of rays to the bone marrow that larger numbers of white blood cells are affected because of daily doses over long periods of time and on a large surface of the body that there is less general reaction and a greater possibility of affecting the organs primarily at fault The radiations are given daily for about five weeks the anterior and posterior surfaces of the body being irradiated on alternate days This method undoubtedly deserves further trial Other chapters deal with Grenz ray therapy radiation therapy in chest conditions radiation in gynaecology etc Practically speaking all diseases which may be amenable to radiation treatment are described special attention being paid to recent methods Chapters which will be of interest to many are those on cancer cures and injuries in radiation therapy

The book is well illustrated with *x* ray photographs and diagrams and an excellent index makes it quite easy to use as a work of reference It will be welcomed by all who specialize in this subject and who find increasing difficulty in keeping in touch with the numerous journals of radiology published in their own and in other countries

BLOOD TRANSFUSION FROM THE DEAD BODY

The book on Transfusion of Blood from Corpse to Patient[2] by Professor SERGE JUDINE is an account of work carried out at the author's emergency surgical clinic in Moscow where insufficient live donors are available and considerations that would affect British surgeons and British hospital authorities do not seem to apply Schamoff of Dniepropetrovsk experimented with dogs and found that animals bled up to 90 per cent of their blood volume could be revived satisfactorily with blood collected from the corpses of other dogs provided the blood was of a compatible group Such blood retained its oxygen carrying function and had no toxic effects after being kept for ten hours In human cases the bodies chosen were those of subjects who had died from street accidents (without possibility of blood infection through the wound) from angina pectoris and other forms of heart failure and cases of suicide by hanging or drowning

No evidence of intravascular clotting in the corpse was found up to eight to ten hours after death and in over 100 cases of transfusion there were no signs of toxicity of the blood Preservation of the body at temperatures

Felsol

below 0° C does not injure the red cells Infection of the blood in the mesenteric veins occurs twenty hours after death at room temperature The blood is obtained from the internal jugular vein, using sterile precautions with the body in the Trendelenburg position A cannula is introduced into the vein in the direction of the head and the blood conveyed to a vessel containing 4 per cent sodium citrate solution by means of rubber tubing The yield from corpses with intact vascular systems is 1,500 to 2,500 c cm Such blood is stored at 1° or 2° C , and has been used successfully after keeping for sixteen days

The general impression the author has is that, following transfusion with blood older than ten days, there are more complications and post-operative troubles, though the immediate beneficial effects are the same as with fresher blood He believes also that corpse blood less than ten days old gives fewer and milder reactions than blood from living donors Bacteriological cultures of the corpse blood are made at all stages, from the moment of obtaining and through the period of keeping The blood of the corpse keeps its specific agglutinative properties In addition to the usual grouping with stock serums, a direct test was always carried out between recipient's serum and the corpuscles from the corpse The Wassermann reaction was found to be unaffected in the serum of the latter No special transfusion technique was employed , the stored blood was raised very slowly to 40° C prior to use Clinical results are recorded in various types of cases

Notes on Books

It is surprising how many parasitic worms infect the human eye and Madame LAIGNIER-TERRASSE has done a service in collecting the available information in a single volume (*Nemathelminthes et Plathelminthes de l Appareil Oculaire Humain*) of 185 pages She classifies these parasites in two groups—the first causing a remote toxic effect on the eye (ascarids, pin-worms hookworms, and the broad tapeworm), the second acting directly This group is also subdivided into parasites causing an exophthalmia (trichinosis, sparganosis, hydatid and cysticercosis) and those not causing this condition although appearing continuously or intermittently in the eye (loa, thelazia, and bilharzia) The volume contains adequate bibliographies and about twenty illustrations—mostly rather poor It should however, be of considerable use to those who are interested in tropical diseases of the eye

The current number of *Tabulae Biologicae Periodicae*[8] contains a wide variety of useful data One article of thirty pages summarizes the muscle physiology exclusive of the two large divisions of heat formation and chemistry of muscle The two last mentioned subjects have attained such a predominance in recent years that there is a danger of work in any other field being neglected, and for this reason this article is particularly useful One of the most interesting features of the volume is a short summary of the known pharmacological properties of histamine and of acetylcholine The figures given are somewhat surprising, for the minimum concentrations that produce an effect on isolated organs are mostly in the range of one part in 1 milliard to one part in 10 milliards and the minimum doses that produce an effect on the cat's blood pressure are given as 0 000001 mg histamine and 0 0000000024 mg acetylcholine The fact that living tissues are affected by such quantities of drugs raises interesting problems regarding the nature of cell structure and the physical chemistry of drug action Other articles in the *Tabulae* provide collected data about radiochemistry enzyme actions, and vitamin research

It is announced in the *Medical and Dental Students Register*[9] that the number of medical students registered in 1932 was 1,947, representing an increase over the previous year of 304 This last figure was made up of 170 at English training centres 82 in Scotland and 52 in Ireland The number of dental students registered in 1932 was 322 an advance of 26 on the figure for the previous year In this volume will also be found the regulations of the General Medical Council relating to such registrations, and a list of the examining bodies whose regulations fulfil the conditions imposed in respect of preliminary examinations

The monograph on Meningeal Spirochaetosis,[10] by MM JEAN TROISIER and YVES BOQUIEN contains a full and up-to date account from the historical pathological clinical, and experimental aspects of the invasion of the meninges by the spirochaete of Inado and Ido The work is of particular value because the senior author has devoted special attention to the subject since 1916, as can be seen by his communications to various Paris medical societies In addition to the ordinary meningeal form of spirochaetal infection, the authors describe a variety characterized by numerous relapses, a subicteric meningeal form which represents a transition between spirochaetosis icterohaemorrhagica and the pure meningeal form and a rare meningo renal form The affinity of the spirochaete for the meninges is not confined to the human race The disease can readily be inoculated into animals such as the guinea-pig, rabbit, monkey, or dog, as is shown by the record of the authors' experiments A bibliography of the literature of the various forms of spirochaetosis is appended

The 1933 edition of the *Scottish Youth Hostels Handbook*[11] with its foreword by Sir J M BARRIE reveals the rapid progress made by those concerned with promoting an organization which it is difficult to realize was founded so recently as 1931 This is much more than a directory of shelter-places for those engaged in exploring their own country and gaining at the same time physical health and new knowledge Maps and short descriptive articles and paragraphs indicate routes of exploration which will lead to places of historic interest or natural beauty, illustrated in some cases by photographs which are incentives to see the originals in the charm of their colour and setting Again an excellent lead is given to those in other parts of Great Britain who might well attempt to rival this publication, and so do something practical to help the young people of to day and to morrow to guard themselves against the threats to health and outlook which are imposed by the modern tendency to urbanization

Preparations and Appliances

A METERING VALVE FOR GASES

Dr E ROLAND WILLIAMS (Clynderwen Wales) writes It is perhaps not generally known that the 'regulators' made by the British Oxygen Company for industrial uses serve as excellent reducing valves for anaesthetic purposes They are very strongly made and are fitted with a safety valve and pressure gauge Being mass produced for to meet a large industrial demand they are much cheaper, albeit a little heavier than the reducing valves especially manufactured and listed for anaesthetic purposes They are supplied in a form that fits on to the ordinary oxygen CO_2 or N_2O cylinders and can be set to deliver any of these gases at a practically uniform pressure of five pounds to the square inch until the cylinder is nearly empty After using two of these regulators for a considerable time in my general practice it occurred to me that since the delivery pressure was constant it would be possible to modify the outlet valve so that it would act not only as a fine-adjustment valve but also as a metering

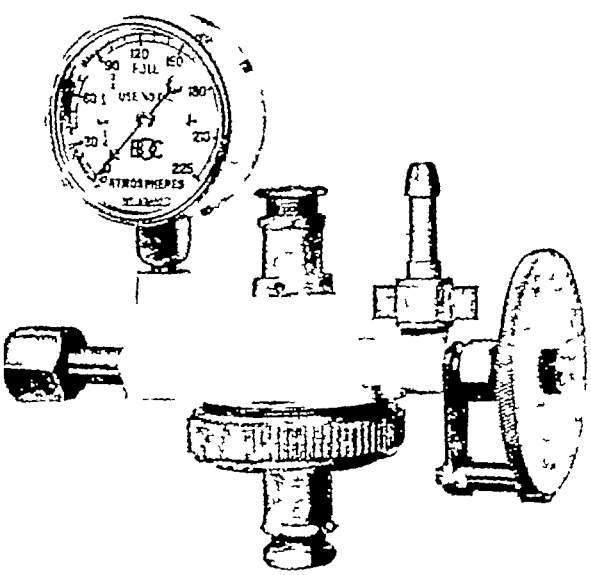
valve thus making it unnecessary to use a flowmeter when administering a mixture of oxygen with N_2O or with CO_2. I was able to contrive a tap on these lines and later as it had proved satisfactory in use I conveyed my suggestions to the British Oxygen Company. They kindly interested themselves in the matter and now their regulators can be obtained fitted with a metering type of outlet valve which gives effect to my suggestions.

This outlet valve is of the ordinary pin valve fine adjustment type but the disk wheel operating the spindle is calibrated so as to show the rate of flow in litres per minute. The range on one turn of the disk is from half a litre to forty litres per minute. The valve is also furnished with a spring and plunger ratchet giving a click for each division marked on the disk. This renders it unnecessary for the anaesthetist to look away from the patient when adjusting the flow. There is a simple arrangement whereby the valve can be reset periodically to allow for any back lash that may develop due to wear on the valve facing. The valves are coloured to match the cylinder colours of the gases with which they are meant to be used—white for oxygen black for N_2O and green for CO. The black or the green valves should not be used for oxygen. In the case of the oxygen valve it is essential that it be fitted with a pressure gauge so as to show how much gas there is in the cylinder a fresh cylinder being turned on when the pressure is down to about five atmospheres. In the case of the other gases the gauges do not in the same way register the exact contents of the cylinders but they are handy in that they give the anaesthetist some warning when to be ready to turn on fresh cylinders. (In the case of CO and N_2O cylinders the gauge needle does not begin to move towards zero until all the liquid CO or liquid N_2O has become vaporized in the cylinder.)

The uses to which these valves can be put are manifold.

1. Used with an oxygen cylinder in the ordinary way they provide a far better means of regulating the rate of flow than that afforded by holding up the end of the delivery tube to the ear and judging by the hiss of escaping gas.

2. When administering oxygen or a mixture of oxygen with



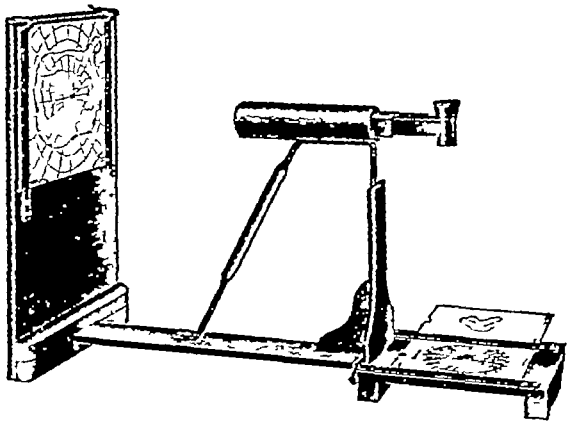
CO_2 they render it possible to give exact instructions as to dosage even to unskilled attendants—for example. Turn the white valve to the ten mark and the green valve to the half mark and let the patient breathe the gases for so many minutes.

3. By fitting these valves any ordinary pattern of dental gas apparatus can be used for the administration of gas and-oxygen one of the N_2O cylinders in the stand being replaced by an oxygen cylinder of dental pattern.

The valves can be obtained from the British Oxygen Company (Angel Road Upper Edmonton N 18) or from the Surgical Manufacturing Company (83-85 Mortimer Street W 1) for whose good offices I am also indebted in the matter.

A SCOTOMA PROTRACTOR

Mr JOHN FOSTER F.R.C.S. (ophthalmic surgeon Leeds General Infirmary) writes: Since Traquair and others have pointed out the value of comparative perimetry in glaucoma whereby one places on the same chart the outlines of a scotoma—a field taken with a small object at one or two metres and a field taken with a perimeter at 33 cm.—some workers in this field including myself have found it difficult to transfer the outline of a scotoma or field taken with a small object from a scotoma chart to the perimeter chart for



comparison. This difficulty is due to the much smaller scale of the perimeter chart and attempts at freehand drawing from one to the other always end in an extremely inaccurate representation both as to size and to shape. This is especially marked where the blind spot and a small nerve fibre bundle scotoma to take an example are so transferred.

The instrument which I have invented to get over this difficulty is a camera lucida with an erecting prism. A diminishing lens is introduced into the system so that its position can be moved to vary the relative amount of reduction required. The scotometer and perimeter charts are arranged on the instrument as shown in the illustration and having arranged the relative illumination of the two charts by placing the instrument in an appropriately lighted part of the room one can by looking through the eye piece of the instrument observe a proportionately reduced image of the scotoma superimposed over that of the perimeter chart. This can be outlined in a few seconds with the aid of a fine pointed pencil or pen the point of which is also visible simultaneously through the eye-piece. As the position of the diminishing lens can be varied any variety of perimeter and scotoma charts may be used together those shown in the illustration are of two different optical instrument makers.

The instrument is made by Rayner and Keeler Ltd. of 100 New Bond Street London W.

ERGOCHOLIN AND ANGIOLYSIN

We have received two preparations introduced by Dr Joachim Wiernik and Co. Berlin and marketed by Messrs Coates and Cooper of 94 Clerkenwell Road E.C.1. In each case the manufacturers refer to various favourable clinical reports which have appeared in German medical periodicals.

Ergocholin tablets each contain the choline derivative pacyl (8 mg.) and ergot alkaloids (0.5 mg.). This combination is intended for treatment of hyperthyroidism. Ergot alkaloids have been used extensively on the Continent for the treatment of this condition some authors have reported favourably on the results. The ergot alkaloids have a general depressant action on the sympathetic but they do not reduce the pulse rate in hyperthyroidism. Pacyl which has an acetylcholine-like action has been added for the purpose of causing reduction of the pulse rate.

Angiolysin tablets each contain 12 mg. adenosin phosphonic acid and 0.125 gram pyrrhodid dimethylaminophenyldimethyl pyrazolon rhodanide. Adenosin phosphonic acid has been shown to produce a dilator effect on the coronary arteries of animals. The makers state that pyrrhodid has a saturating effect on colloidal tissue which facilitates the access of adenosin phosphonic acid to the coronary vessels.

FEE-SPLITTING AND THE LAW

[FROM A LEGAL CORRESPONDENT]

At the end of his opening address to the General Medical Council on May 23rd the President, Sir Norman Walker, warned medical men that the practice of fee-splitting or dichotomy, was an offence against the law as well as against the good feeling of the profession, and that any conviction in the courts would inevitably bring the offender within the jurisdiction of the Council. The present note deals solely with some legal aspects of a practice which is condemned by every right-thinking member of the medical profession. The principle of law, as stated by Halsbury, is that an agent must not, without the knowledge of his principal acquire any profit or benefit from his agency other than that contemplated by the principal at the time of making the contract of agency. *The general practitioner who calls a specialist into* consultation on a case is the patient's agent for that purpose, the terms of the contract of agency being that in return for the practitioner's skill' and experience in choosing a suitable specialist, and for his services in co-operation with the specialist and his trouble in arranging consultations, the patient pays him a fee either agreed beforehand or reasonable in the circumstances. It is obviously most undesirable that the practitioner should receive or withhold a part of the fee from the specialist without the patient's knowledge, for such a practice would encourage a tendency among advisers to call in, not the best specialist for the purpose, but the man who would hand over to them the largest proportion of his fee.

There seems to be no reason why the law should not deal with medical dichotomists in exactly the same way as it deals with commercial agents who receive secret commissions or bribes. If this view is correct then a general practitioner who agrees to take part of the consultant's fee commits both a civil wrong against his patient and an offence against the criminal law. It does not even matter whether he is influenced by the bribe to the prejudice of his patient's interest, he is guilty even if his patient does not suffer any harm. When a commercial agent is found to have received a bribe he *can claim no commission for the transaction, and becomes* liable to pay to his principal not only the amount of the bribe but also interest at 5 per cent. from the date when he received it. He must also make good any loss his principal has sustained through his breach of duty. In the same way a patient should be able to sue for the return of the fees he has paid to the general practitioner in respect of the specialist's services and also for that part of the specialist's fee which the general practitioner has wrongfully received. He also has an action for any loss or injury he may have suffered through the transaction and this damage is measured, prima facie, by the amount of the bribe. The specialist is, as a guilty party also liable for these damages and it seems probable that he would be liable to return the whole of his fee because the patient would not have employed him but for the bribe. The patient may choose whether he will repudiate the whole contract, or stand by it and obtain such relief as the court may think fit to give him. If he chooses to repudiate the contract presumably he has a right to have his whole fee back. In any event as he is supposed to have suffered damage equal to the amount of the bribe he can apparently claim this amount from the specialist irrespective of what if anything, he has recovered from his usual medical attendant.

Dichotomy as a criminal offence may be dealt with as a conspiracy to defraud or under the statute mentioned by Sir Norman Walker—the Prevention of Corruption Act, 1906 (6 Edward VII, 34). Under Section 1 of the Act it is a misdemeanour punishable with two years imprisonment, or a fine of £500, or both, for an agent corruptly to accept or obtain any consideration as an inducement to show favour to anyone in relation to his principal's business. It is the same offence to agree to accept such a reward, or to attempt to obtain it or to give or offer it. Conviction for this offence as for any other makes a practitioner liable to have his name erased from the *Medical Register* by the General Medical Council without further inquiry into the facts on which the conviction was based.

AN EXHIBITION OF DOCTORS' HOBBIES

In connexion with the forthcoming Annual Meeting of the British Medical Association in Dublin an Historical and Hobbies Exhibition is being organized in Trinity College. It will be open for inspection on Tuesday July 25th *at 11 a.m., and will remain open on July 26th, 27th,* and 28th. The following note addressed to members proposing to visit Dublin, has been supplied by Dr. F. S. Bourke.

OUTSIDE THE CONSULTING ROOM"

Everyone will agree with the truth of the saying 'All work and no play makes Jack a dull boy.' Perhaps to the medical profession more than any other the necessity for relaxation of some kind is nearly every day emphasized. This may explain the fact that so many medical men have turned their attention to other than professional spheres after the exacting duties of the day. The variety of their diversa hobbies which is the term usually applied to such *divertissement*, is quite easy to explain but it is no easy matter to obtain the consent of those concerned to exhibit the results of their labours or activities outside the consulting room as on this occasion we have the privilege to present. We would stress at the outset that this exhibition does not pretend to be anything like complete. Even with the time at our disposal it will be readily understood how impossible it was to get into touch with all the medical men and then to find out the individual hobbies. Whether we have succeeded in our efforts remains to be seen. We have, however endeavoured to appeal to every interest by the variety of the work shown which embraces art including pictures in oil and water colour etchings dry points charcoal, and pen and ink drawings by doctors examples from collections of mezzotints and old masters. Next in favour would seem to be antiquities then fishing a more recent development of which appears to be big game fishing for which we foresee a great future here in Ireland, judging, at any rate from the fascinating account which one of its devotees gives of this exhilarating sport. We are also showing examples of flies tied by some of the enthusiasts of fishing.

How many of us can appreciate the primitive lighting systems in ancient Ireland? Here we are fortunate in having examples of the rushlight holders and candle moulds which are sure to arouse interest and which are now so scarce. China collecting is represented by some magnificent pieces of Spode and we are fortunate in having at least one exhibitor who actually designs and makes pottery himself. The philatelist is not forgotten and we can promise some rare items among those shown including examples of the early Dublin penny post. In coins we are only showing those of Irish origin or use and here also is a representative collection. For the bibliophile we have some specimens of the early presses calculated to appeal to the most fastidious book collector. We are also showing some of the published work in prose and verse by doctors which has obtained universal praise. Were we to continue we would merely make this an enlargement of our catalogue when our purpose is only to arouse the interest of our visitors to see a side of our life which under ordinary circumstances they could never see. We would point out that many of the hobbies do not lend themselves to our purpose—for example many members of our profession have taken up stock breeding and farming.

In conclusion we would ask you to look with a kindly eye on our efforts and to appreciate that in the majority of cases what you look upon was never intended for public view at all but merely as a relaxation outside the consulting room.

GASTRIC SECRETION IN ANAEMIA

It has long been known that in cases of pernicious anaemia a very severe defect in the gastric secretion is usually present Indeed many cases have been reported in which achlorhydria was observed long before the onset of the anaemia Not only is the defective gastric secretion shown by the ordinary test meals but there is a failure to secrete free hydrochloric acid after the injection of histamine As part of an investigation of the relation of gastric secretion to anaemia by a number of workers at Guy's Hospital the results of which were published in the January number of *Guy's Hospital Reports* Dr Hartfall[1] has demonstrated that in the great majority of cases of pernicious anaemia no free hydrochloric acid is secreted after histamine and the gastric juice obtained has on an average an extremely low total chloride concentration and very small quantities of pepsin Exceptions to this are rare but he quotes an example of pernicious anaemia with free acid in the gastric juice, and Dr Hurst[2] records another associated with chronic obstruction of the ileum Castle and his co-workers have demonstrated the presence in normal gastric juice of a ferment-like principle with properties different from pepsin and rennin to which they have given the name of the *intrinsic factor* it acts on the proteins of the diet more especially the vitamin B complex or *extrinsic factor* to produce a substance which has a curative action in pernicious anaemia In typical cases of the disease the stomach secretes no intrinsic factor and according to Castle's theory the absence of this is the essential cause of the disease but its loss does not necessarily run parallel with the loss of other elements of gastric secretion such as free acid chloride or pepsin this provides a rational explanation for the rare cases of pernicious anaemia with little or no gastric secretory abnormality

In pernicious anaemia the normal red corpuscles tend to be replaced by cells which are larger (*macrocytes*) and which therefore each contain more haemoglobin so that the colour index is greater than normal But in 1909 Faber had already discovered that patients with achylia gastrica frequently suffered from a hypochromic anaemia in which the circulating red blood corpuscles were smaller thus bringing the colour index below unity A revival of interest in this group of cases has recently brought out many new facts The patients are usually women at child-bearing age who present a hypochromic anaemia running a chronic course without spontaneous remissions and without increased haemolysis There is usually a leucopenia and relative lymphocytosis A characteristic feature is atrophy and aphthous inflammation of the tongue and pharynx giving rise to dysphagia In addition there are trophic lesions of the skin the nails become rough and easily broken cracks appear on the fingers and at the angles of the mouth the teeth decay and the hair falls excessively The outstanding symptoms are tiredness and easy fatigue Diarrhoea is common and the gastric secretion is upset achylia gastrica is not constant however many cases showing only achlorhydria or considerable hypochlorhydria In a series of 137 cases investigated by Hartfall and Witts complete achlorhydria or extreme hypochlorhydria was present in 108 or nearly 80 per cent. In a considerable number of these cases the effect of histamine injection was noted and it was found that a true achlorhydria was present in a little over half of them The authors believe that the achlorhydria of simple achlorhydric anaemia is not the result of the anaemia but precedes it and predisposes to it The achlorhydria has been demonstrated before the onset of the anaemia The development of anaemias either of microcytic or of megalocytic type after operations on the stomach is one of the strongest reasons for believing in their gastrogenous origin The achlorhydria is usually a permanent phenomenon and persists when the anaemia is cured Moreover it is in many cases a hereditary abnormality and is thus not the result of the anaemia Possible aetiological factors in order of importance are heredity the action of haematogenous toxic agents on the stomach operative or other trauma to the stomach and gastritis from direct irritation of the stomach In a significant number of their cases the authors showed that the gastric secretion was deficient in total chlorides and contained no free hydrochloric acid and little or no pepsin—that is it was indistinguishable by ordinary tests from the gastric secretion in pernicious anaemia Nevertheless it is unusual for these women to develop pernicious anaemia

In an effort to confirm the presence of Castle's intrinsic factor in simple achlorhydric anaemia Hartfall and Witts[4] carried out experiments with gastric digests on four patients with pernicious anaemia The gastric secretion was obtained by histamine stimulation from normal men cases of pernicious anaemia and those of simple achlorhydric anaemia About 200 grams of lean beef steak were thoroughly mixed with the gastric juice obtained from the donor and after incubation were given to the recipient in whom daily observations of the blood were made an adequate reticulocyte crisis was taken as proof of the existence of the active principle in the juice under investigation In these experiments the authors confirmed the presence of the intrinsic factor of Castle in normal gastric juice and its absence in pernicious anaemia the juice obtained by histamine stimulation from women with simple achlorhydric anaemia contains variable amounts of the intrinsic factor of Castle and in some cases only a very small quantity was demonstrable They are not convinced that the present knowledge of the gastric secretion in pernicious and simple achlorhydric anaemia supplies a satisfactory explanation of their differences

Indeed, there is much experimental and clinical evidence that life and health may be maintained after extirpation of the whole stomach, and we may have to look elsewhere for the final solution of the pathology of these anaemias That the intestine may be the site of trouble in some of the macrocytic forms is evident in such conditions as sprue, and van Leeuwen[5] has shown that microcytic anaemias may be due to a malabsorption of iron owing to intestinal disease when the gastric secretion is normal There may not yet be evidence enough to justify the acceptance of these anaemias as a specific disease, but it is clear that a syndrome exists with the clinical picture above described, usually associated with achlorhydria and curable by sufficient doses of iron For the present they may be classified under the heading of idiopathic hypochromic anaemia,[6] until further work leads to better differentiation

ACADEMIC ASSISTANCE COUNCIL

In the *Journal* of June 3rd (p 974) we reported the formation by a number of British men and women eminent in the fields of scholarship and science of an Academic Assistance Council, having for its object the raising and administration of funds to enable foreign university teachers and investigators who are at present prevented from carrying on their researches in their own countries to do so, for a time, elsewhere We understand that the council has appointed an executive committee, of which Lord Rutherford is chairman, and that the committee has begun work on its Herculean task Our country may well be proud of her responses to the appeals of scholars who have found shelter on her soil More than three centuries ago the great humanist Isaac Casaubon found an asylum in England More than two centuries ago Abraham de Moivre sought shelter here and, in England, carried out researches which are the foundation not only of much pure mathematical science but also of modern systems of life assurance We have indeed succoured many men of genius, who repaid the debt in the only way honourable men could wish it to be repaid, by enlarging the bounds of knowledge That the Academic Assistance Council's appeal for support will find a ready response within our own profession is certain In these days of rapidly accumulating knowledge general culture, in the old-fashioned sense, may be on the wane , but there can be no doubt of the catholicity in intellectual achievement and interests of a profession which recently counted among its members Thomas Clifford Allbutt and Edward Granville Browne and is still fortunate enough to possess the president and an ex-president of the Royal Society We note with satisfaction that the Academic Assistance Council bases its appeal on the ground of intellectual obligation, of gratitude to those who have increased and will continue to increase the stock of human knowledge, and wholly abstains from any utterance which might be construed as an attack on individuals or institutions in foreign countries No useful purpose could be served by language tending to wound national susceptibilities already inflamed We also commend the prudence of the council in limiting the scope of its activities

"Of possible places of refuge in case of necessity," wrote Mark Pattison in his life of Casaubon, "there remained—England Had it been 200 years earlier nothing would have been more simple, than that a learned man, who was dissatisfied in Paris, should have migrated to Oxford, for a time, or for life But now it was different Neither North nor South Britain entered in the comity of nations, in such a way that natives of all countries indiscriminately circulated through our universities, either as students or professors as they had once done, and as they still did in the other parts of western Europe" The necessity for the final reservation in favour of countries other than England no longer exists The free circulation of learned men which characterized an age when learned men were few and used a common tongue is long past It would be idle to pretend that among the university teachers on the Continent who are suffering persecution for political or racial reasons there are not many who, while perfectly competent to perform creditably the duties of such posts, are not more competent to do so than equally large numbers of persons already filling or ambitious of filling similar posts in this country It would be equally unwise to make such a pretence with respect to members of other professions No humane man can read of professional colleagues losing their means of living through no fault of their own without pity and a strong desire to help Were England El Dorado we should all desire to offer hospitality to any liberally educated person suffering unmerited misfortune But England is not El Dorado , it is a sorely distressed industrial State, already carrying more than its share of the world's burden We are, however, still capable of working for the common good of mankind, still prepared to make sacrifices for those who *quasi cursores vitai lampada tradunt*

In the delicate and responsible task of identifying those who are indeed handing on the vital torches the Academic Assistance Council deserves and will receive the support of the whole medical profession But, for the sake of the torch-bearers themselves, no encouragement must be given, either here or abroad, to the hope that any, even temporary, migration to this country of more than small numbers of exceptionally gifted individuals is within the bounds of possibility As is pointed out in an editorial in *Nature* of June 17th "In teaching and research, competition for appointments at the moment is intense , and it would be neither fair nor practicable for a 'most-favoured nation clause' to be extended to displaced German teachers and research workers It should be no matter for surprise that, while the appeal has been received with much sympathy, it has aroused misgiving, in view of the financial situation and the difficulty of finding appointments for

BATH

THE SPRINGS

Hyperthermal 120° F.

The only hot springs in Britain

Radio-active

Radon (radium emanation)
In water 1·73 millimicrocuries per litre
In gas 33·65 do do.

Diuretic

Solvent

Calcium salts - high
Sodium salts - low

Promotes elimination of uric acid

Calcium salts diminish mono-sodium (uric-acid precipitating) phosphates in the urine leaving the di sodium phosphate (uric-acid dissolvent) unaffected

Prescribed in

1 Arthritis and allied conditions
2 Gout
3 Gouty Glycosuria
4 Gastric Disorders
5 Renal Calculus

Note —

THE KEYNOTE OF THE BATH SYSTEM

is the regulation of disordered function by

(a) Eliminative methods—
e.g. Sweating treatments Colonic Douches

(b) Sedative methods—
e.g. Immersion

(c) Stimulative methods—
e.g. Tonic Douching etc.

(d) Special methods—
e.g. Re-educative Movements etc etc.

The following list of cases in which the Bath Treatment is specially indicated may be useful —

1 Arthritis and allied conditions
2 Fibrositis including sciatica and other forms of "rheumatic" neuritis
3 The various stages of articular and abarticular gout.
4 Functional diseases of the nervous system.
5 Certain organic diseases of the nervous system paraplegia and various forms of toxic neuritis
6 After-effects of injury
7 Functional and certain organic heart diseases
8 Hypertension, particularly that form due to arterial spasm
9 Colitis.
10 Certain pelvic disorders in women.
11 Chronic skin diseases.
12. Chronic rhinitis pharyngitis and laryngitis.

Special attention is being given at Bath to —
(a) Preventive treatment.
(b) Tonic Treatment.

Contra indications —
Acute conditions of joints tubercular arthritis advanced cardiac disease aneurism.

COST

Treatments according to tariff or the Bath Cure Ticket, covering all treatments ordered, three weeks course for 3 guineas

(June to September)

During May the charge is 4¼ guineas for three weeks for all treatments or 3 guineas for certain treatments only

ACCOMMODATION

Hotels etc., to meet all requirements from luxury hotels to inexpensive apartments A detailed list, with charges will be sent, on request, by the Official Information Bureau.

DIET

All the principal hotels carry out diet regimes to the physicians orders

INVESTIGATION

All facilities for pathological X-ray and other examination.

The Royal Mineral Water Hospital at Bath founded 1742 is a National treatment and research centre for rheumatic diseases

The Spa Director will be pleased to answer enquiries from medical men desiring further information about the Bath System of Treatment.

Further announcements will appear in early issues

Address - THE PUMP ROOM, BATH. *Telephone 4227 Bath.*

trained scientific men many with high qualifications from our own universities and places of higher education while among school teachers the position is equally if not more grave Obviously it would be far from politic and indeed unfair to the displaced teachers and research workers to offer them posts in a market which is already overstocked These and other difficulties are realized by those who are endeavouring to meet the situation in this country The moderation of the Academic Assistance Council's appeal both in its language and its scope must command the approval of all Even so limited the pecuniary requirements must be very large and we are sure that all will do their utmost to help an eminently worthy undertaking

THE REGISTRATION OF MEDICAL STUDENTS

At the May session of the General Medical Council in 1904 a resolution was passed that the Lord President of the Privy Council be requested to introduce into Parliament a Bill to confer upon the General Medical Council statutory power to establish and maintain registers of medical and dental students and to impose a fee not exceeding £1 for registration therein In the following session the Lord President was further addressed by the Council and the request to introduce the Bill was withdrawn the reason given being opposition by certain licensing bodies The opposition came from the Royal College of Physicians of London and the Royal College of Surgeons of England and the grounds of opposition were that the proposed Bill would infringe the powers of the Colleges safeguarded in the Medical Acts of determining the conditions of admission to their professional qualifications Since that time the Council has maintained a students register on a voluntary basis and the medical schools have been invited to recommend all entering students to place their names upon it Had the statutory power been obtained the Council would have had direct control over the length of the course of medical study in each individual case and also over the conditions of enrolment as a medical student The latter would have given it powers to prescribe the courses of study and examinations to be taken before admission to the *Students Register* In spite of its possessing no such powers the Council has sought to exercise them by resolutions and recommendations and has required as a condition of enrolment on its voluntary *Students Register* the passing of one examination in general education and of another in physics and chemistry it has prescribed the subjects and type of examination in each case and brought pressure to bear upon any medical school where the entrance examinations did not conform to its prescriptions Much confusion has arisen as the result of this action and the arrangements which have been made by the medical schools with a view to conforming to the letter of the Council's resolutions have been various Several factors have contributed to this confusion but these need not now be enumerated At the present time there are medical schools which do not hold any preregistration examination in chemistry and physics but teach them within the five years course there are schools which require an entrance examination in these subjects but no further study of them by their students there are schools which hold a pre-registration examination based on one term's work and there are others which maintaining that the student should be taught physics and chemistry within the medical school itself have added a year to the curriculum and occupy this year with instruction in these two subjects and biology This state of affairs is unsatisfactory and has arisen out of the unusual course taken by the Council in seeking to impose on the medical schools and their students requirements which it has no statutory right to enforce There appear to be but two ways in which it can be ended either by the General Medical Council's obtaining powers to regulate preliminary studies and examinations or by its ceasing to exercise a control the right to which is not conferred upon it by the Medical Acts so leaving the regulation of admission examinations to the medical schools themselves

SO CALLED IDIOPATHIC HYPERTROPHY OF THE HEART

A contribution by Howland to the Osler Memorial Volumes [1] on idiopathic hypertrophy of the heart in young children served to make the existence of this condition more widely known and cases have since been described from many centres In a recent article M A Kugel and E G Stoloff [2] claim to review all the reported cases of the condition with complete clinical *x*-ray and pathological studies of seven additional patients of their own making in all fifty-nine cases The clinical picture is that of a young child usually in the first or second year of life who either dies suddenly with or without signs of acute heart failure or with a more insidious onset becomes fretful has attacks of syncope with cyanosis or of sudden dyspnoea and dies in an attack Fever is absent the pulse is rapid and physical examination usually reveals a very large heart confirmed on *x*-ray examination Another feature is lack of signs or history of congenital malformation of the heart rheumatic fever diphtheria or other known infection The child has generally been perfectly well until the sudden manifestation of the disorder The earlier reports stressed the fact that microscopical examination of the myocardium showed only simple hypertrophy of the muscle bundles More systematic examination—especially by standardized sections including all the valves left and right auricles left and right ventricles the intraventricular septum and the papillary muscle—indicates that other changes are frequently present such as degenerative lesions fibrosis and lymphocytic infiltrations The present authors therefore regard pure idiopathic hypertrophy of the heart as a very rare condition and they classify the existing cases as follows a group of true congenital idiopathic hypertrophy of the heart in which no aetiological factor was discovered and a thorough histological examination demonstrated a pure hypertrophy with no demonstrable pathological lesions (seventeen cases) a secondary form of hypertrophy in which histological examination showed myocardial damage (this included certain cases with anaemia congenital anomalies intrapulmonary disease or primary vascular disease—twenty seven cases in the literature and the

A STUDENT'S MANUAL OF BIRTH CONTROL

By LILY C. BUTLER, M.R.C.S., L.R.C.P., D.P.H.
Medical Officer, Walworth, East London and Lambeth Welfare Centres (Society for the Provision of Birth Control Clinics)

There are many excellent text-books on contraception available which should be studied by those who are interested in all aspects of the work, but the overworked medical student and the harassed practitioner have not time to go into details of every known method, some practical but some merely theoretical, nor is it essential for them to do so. This small book gives them all the information they require.

Diagrams. Paper 1s. 6d.

WOMAN'S PERIODICITY

By MARY CHADWICK
Author of Psychology for Nurses, Difficulties in Child Development, Nursing Psychological Patients, Adolescent Girlhood

The fact that the physical and psychological health of a woman fluctuates has been recognised from the earliest times and attributed to various causes. The connection between the two aspects has, however, not always been made clear nor have the deeper psychological roots been given the attention they deserve in order that the frequent disturbances they occasion may be understood.

ARTHRITIS

The personal testimony of so many members of the Profession as to the efficacy of Gorun in the treatment of arthritic conditions lead us to place these brief facts before you.

Gorun—a combination of Glycocoll, Phenyl-Quinolin-Carboxylic Acid, and Hexa-methylene-tetramine—corrects faulty metabolism and relieves pain, thus removing both cause and effect.

Full details of medical experiences, literature, and samples will be gladly sent on request

"INTESTINAL CORRECTION" HERBARAS plant seeds are a specially selected perfectly sterilised species of the plantago family. The medical profession can prescribe them with confidence in cases of chronic constipation. "NEW HEALTH (Organ of the New Health Society) says: "The Herbaras plant seeds are very tiny and when soaked in water swell up into a soft jelly—gently sweep along the walls of the intestines—collect the waste matter—leaving a clean and heal by bowel. Samples will be sent to any physician on request. Address Mr. JOHN W. LONGMAN, Foreign Produce Merchant and Importer, Clyde House, M. 489a Oxford Street, W.1.

seven here reported), and a third group (eight cases), in which a complete examination was not reported, and hence no definite classification could be made. The aetiological factors are obscure, and on the whole the evidence, in the genuine cases, is in favour of a true "germ-plasm" defect, since a familial incidence has been recorded by some authors, and in a particular group in which two brothers married two sisters, being first cousins as well, there was a definite case in a child of one pair and four likely cases in four children of the other pair. Other theories include one which links the heart condition with an enlarged thymus, but, as the present authors point out, in the sudden death which is common among these cases a normal degree of lymphoid tissue is often found. Hypertension, either in the mother or the affected child, can generally be ruled out, while in some cases infection may play a part, especially whooping-cough. This is most likely to be true in the second group of cases, in which pathological lesions are present in the myocardium. Drs Kugel and Stoloff are inclined to think that a more careful study will demonstrate such lesions in nearly all cases, and that the true so-called idiopathic hypertrophy of the heart in infancy will probably disappear as a clinical entity if the rigid standards they lay down are accepted. Their claim to have collected all the cases in the literature—always a dangerous claim to make—can be disputed by the citation of a case not mentioned by them and exhibited at the Section for the Study of Disease in Children of the Royal Society of Medicine in October, 1929, by Dr Alan Moncrieff.[1] In this instance a baby of 1 year had recurrent attacks of unexplained dyspnoea and cyanosis, in one of which she died. Clinical examination had shown a very large heart, and histological examination revealed an apparently pure hypertrophy of the cardiac muscle.

THE TEETH IN FORENSIC MEDICINE

That individual differences in the human subject may be recognized as easily by dental examination as by a study of, say, the physiognomy seems not unreasonable. Forensic medicine already has anthropometry and dactylography to assist it in the more difficult problems of identification, but Mr B. H. Humble, who makes an extremely interesting contribution to the literature,[2] shows that greater use might be made of dental evidence in this respect. If he is right—and there seems good reason in favour of this—the criminal of the future must expect a life full of shocks, while we may anticipate a rapid diminution in the number of unidentified bodies. Among historical examples where the teeth have been instrumental in settling identity Mr Humble quotes the case of Charles the Bold, whose body was found on the field of Nancy in 1477, the famous Parkman and Webster case in 1849, in which a murderer's guilt was established by the recognition of a platinum and gold denture among the clinkers of a laboratory furnace, the occasion, in 1879, on which the mutilated body of the French Prince Imperial was identified by means of filled molar teeth, and the touching story of how a Chilean dentist saved his country from possible war when, in 1908, he established the fact that the consul of an important European power had not, after all, been murdered! More recently, an impostor masquerading as a Grand Duchess was convicted on data supplied by a plaster cast of the jaws, while M. Lowenstein, whose body was recovered from the English Channel in 1928, was not recognized positively until dental evidence had been brought forward. Passing from a consideration of marks left by the teeth on food, the author recalls how, in the Düsseldorf murder case, the impression of a complete front dentition found on the skin of the victim finally led to the identification of the murderer. In a second case, in which toothmarks were found on the forearm of a murdered man, the prosecution was unsuccessful—despite close correspondence between a plaster cast of the defendant's teeth and the marks—owing to post-mortem changes which had taken place in the skin. In yet another German case, however, photographs of the toothmarks in the victim's skin were taken immediately, and before there was any time for contraction to cause change in shape. By this means Dr Sorup was able to incriminate one of two suspects by using plaster casts, from which marks were made on paper and compared with the photograph of the original toothmarks. Mr Humble describes his modification of Sorup's method. He suggests that there will, sooner or later, be a much larger number of insured persons coming under dental benefit—in Britain the present figure is estimated at about 1,000,000. When more people have dental treatment there will be a greater number of records of the teeth, and dentists will be able to narrow the field of identification. There are many morphological characteristics in each tooth, and these, with the possible addition of fillings, inlays, crowns, partial dentures, or absence of one or more teeth, will be of considerable assistance in this direction. Mr Humble urges that, where a body is unidentified, a full description should be published, and a dental surgeon called in to make a careful examination of teeth and jaws. His description could then be circulated in the dental journals, with the hope of bringing the necessary dental identification to bear on the problem. This method has already been in use in Germany, and there seems no reason why it should not be employed here.

ACCIDENT PRONENESS

In a report of the Industrial Health Research Board on "Tests for Accident Proneness"[1] Messrs E. Farmer, E. G. Chambers, and F. J. Kirk describe a further instalment of their systematic study on the part played by individual susceptibility in accident causation. It has long been known that certain individuals are much more liable than others to incur accidents in the course of their daily work, and it is evident that if such individuals could be weeded out and transferred to other occupations where they had less chance of incurring accidents the average accident rate of the whole community would be reduced. The difficult problem is to identify these accident-prone persons, and so be enabled to transfer them before they have had much opportunity of exhibiting their susceptibility. It is not easy to find suitable groups of subjects for examination, for it is desirable that those selected should be kept under observation for several years in order to increase the

[1] Medical Research Council, Industrial Health Research Board. Report No. 68. Tests for Accident Proneness. By E. Farmer, E. C. Chambers, and F. J. Kirk. London: H.M. Stationery Office. 1933. (6d. net.)

reliability of the results obtained The investigators were fortunate in obtaining permission to test all the apprentices entering the naval dockyard at Portsmouth and they obtained statistics relating to groups of 101 shipwrights and 150 fitters for a five year period They also tested 163 naval artificers for a three year period The subjects were given certain sensorimotor tests (reaction time dotting pursuit meter) which previous investigations had shown to be suitable and on comparing their test performances with their accident rate it was found that one group the shipwrights showed a fairly high correlation between the two variables They showed it steadily throughout the test period and as they incurred accidents about three times more frequently than the other groups of youths tested the results were of special interest They were indeed of some direct practical interest for it was calculated that if the small number (amounting to 12 per cent of the whole group) of shipwrights who incurred two or more accidents in their first year had been rejected the remainder incurred 13 per cent less accidents in subsequent years than those actually observed in the whole group If however the shipwrights were divided into four equal fractions according to their performance of the sensorimotor tests and the fraction who did worst were rejected the remainder were found to incur 20 per cent less accidents than those observed If a more stringent selection were adopted and only the fraction who did best at the tests were retained they were found to incur 39 per cent less accidents than those observed in the whole group The investigators point out that they have no evidence that the particular tests employed are the best for the purpose In course of time other tests may be evolved which give much more striking results than those already attained It appeared that intelligence tests were of no value for the elimination of accident prone individuals in the particular occupations studied This might have been expected for the accidents sustained were mostly cuts and bruises caused by the faulty manipulation of tools but it is obvious that in some occupations intelligence tests must be of value

THE UNIVERSITY OF LONDON

The work of excavation on the Bloomsbury site for the new buildings of the University of London has been actively proceeding (at the southern end of the site nearest the British Museum) since the end of last year and matters have advanced sufficiently to enable the foundation stone to be laid by the King on Monday next June 26th In the report by the Principal of the University on its work during the year 1932-3 reference is made to the handsome gift of the Corporation of the City of London of £100 000 towards the cost of the new ceremonial hall This gift has been followed by other splendid benefactions towards the same purpose from a number of the City Companies including the Apothecaries Society the amount totalling to over £166 000 The further identification of these famous guilds with the university is regarded with very much gratification The same report recounts other gifts not connected with the Bloomsbury site One of these is a generous gift by Lord Riddell to enable the Royal Free Hospital to complete a wing of the hospital building thus providing more clinical facilities which will indirectly benefit the work of the hospital school The Chair of Public Health tenable at the London School of Hygiene and Tropical Medicine has been endowed by the Prudential Assurance Company for a period of seven years and is to be known as the Prudential Chair of Public Health The School has also received £2 000 to establish a fund for the advancement of study and research in entomology as a memorial to the first Lord Avebury a former vice-chancellor of the university Mr S A Courtauld has added to his munificent gifts to the Middlesex Hospital Medical School a further sum of £20 000 towards the endowment of the Biochemical Institute Another gift of £48 000 has been made by the Rockefeller Foundation for the endowment in connexion with University College Hospital and Medical School of a post the holder of which will devote his whole energies to the advancement of clinical research In dealing with the organization of teaching the Principal mentions the institution of a new academic diploma in medical radiology also the institution of readerships in pathological chemistry at the Cancer Hospital and in experimental pathology at the Lister Institute The Court of the University has made grants of £10 000 to King's College Hospital Medical School and to St Mary's Hospital Medical School in both cases towards the cost of new buildings which are approaching completion

EPSOM COLLEGE

Now that the voting system has been abolished the beneficiaries of the Royal Medical Foundation of Epsom College are elected by a conjoint committee consisting of twenty governors ten being members of the council and ten non-members of the council This committee met on June 14th to elect (*a*) eleven foundation scholars who will receive education board clothing maintenance and pocket-money free of all cost whatsoever and (*b*) two ordinary pensioners who will receive £40 a year namely £30 from the general funds of the college and £10 from a special fund There were no fewer than twenty-four candidates for the eleven vacant scholarships and forty-six candidates for the two vacant pensionerships The result of this election will be found in our advertisement pages to-day In view of the large number of candidates who cannot stand again owing to age the council has decided to maintain fifty-four foundation scholars instead of the usual number of 50 This will cost the foundation in 1933 an extra sum of £600 which means that contributions totalling some £10 600 must be collected in subscriptions and donations—a task by no means easy in these days

HARVEY MEMORIAL TOWER

The rebuilding of the Hempstead Church Tower (William Harvey Memorial) has been commenced and the foundation stone will be laid by Lord Davison of Penn on Friday July 7th at 3 30 p m Any member of the medical profession will be welcome Those desirous of attending should notify the Rev T P Conyers Barker the Vicarage Hempstead Saffron Walden Essex Arrangements will be made for those who desire to travel by coach from London provided notice is given to Mr Barker by July 3rd There will be tea at the vicarage after the ceremony With the funds in hand only the first section of the work can be completed but it is hoped that further donations will be forthcoming They should be sent to Dr Arnold W Stott 58 Harley Street W 1

NEW ZOOLOGY DEPARTMENT AT UNIVERSITY COLLEGE

The Earl of Athlone, Chancellor of the University of London who was accompanied by Princess Alice, opened the new building for the Department of Zoology and Comparative Anatomy at University College on June 12th The department in its new home embodies one of the most important developments of the college in recent years Eighteen months ago the college acquired a site to the south of the great building which houses the departments of anatomy and embryology, physiology and biochemistry, and pharmacology The site contained a range of buildings surrounding the courtyard (which is to be known as Foster Court, in memory of the first provost of the college, the late Sir Gregory Foster), and the building on one side of this courtyard has been adapted for the new department It consists mainly of three floors, with some rooms on a fourth, and includes a theatre (named after Ray Lankester), classrooms research rooms, workrooms, and teaching laboratories, a museum and preparation room, and accommodation for living material in the shape of a large aquarium, a series of constant temperature rooms and an animal house for the maintenance of small animals for the use of geneticists The whole building is severely utilitarian, except for a beautiful seventeenth century gateway, possibly designed by Wren, removed from the hall of the Pewterers' Company, and re-erected here, where, amidst plane-trees, it offers one of the pleasantest views in the college precincts

SIR JOHN ROSE BRADFORD chairman of the college committee who presided over the brief function said that a department of zoology was established at University College in 1828 very shortly after the college itself was founded It had had some half dozen professors but he made no apology for mentioning one outstanding name that of Edwin Ray Lankester who was appointed to the chair of zoology in 1874 The department under his inspiration became a centre of extraordinary activity where researches were carried on in many fields and the personality of its professor attracted men of ability so that presently a large proportion of the chairs of zoology in the Empire came to be filled from University College It was just fifty years said Sir John Rose Bradford since he became Lankester's demonstrator and there were few men for whom he retained so great an affection He was a strong personality caustic of speech and unable to suffer fools gladly but remarkable for his enthusiasm for genuine scientific work and especially for the generosity with which he acclaimed the work of colleagues With him he linked another great name of the same period at University College that of Burdon Sanderson, who was professor of practical physiology and Jodrell professor of human physiology In appearance no two men could have been more unlike than Lankester and Burdon Sanderson But they had this in common that they both sought the larger view in all their work, and did their best to inculcate general principles which up to their time had never been recognized

THE EARL OF ATHLONE paid a tribute first of all to Sir Gregory Foster a tablet to whom he had just unveiled He said that Sir Gregory was one of those who had realized the new fields which were opening up to zoology and the evident influence of this science upon human thought in general and the practical problems of the modern world He induced the college to set itself to the task of providing new laboratories for adequate study with fresh equipment and an enlarged staff The Chancellor went on to acknowledge the great financial assistance which had been furnished from two quarters The cost of the site building and equipment of the new department had been as to by far the larger part defrayed by a grant of £30 000 made by the university court out of the capital grant of £150 000 by the London County Council for the quinquennium 1931–5 For the endowment and upkeep of the new work the college had received a benefaction on specially generous conditions of £88 000 from the Rockefeller Foundation

Professor D M S WATSON the Jodrell professor in expressing to the Chancellor the thanks of those assembled said that those concerned for the progress of the college had realized in particular the necessity of providing staff and laboratories for the study of genetics comparative physiology and animal behaviour so as to ensure an adequate training for students in zoology Animals must be studied as live things not in the restricted sense of the older zoology but in their more interesting and vital aspect from the point of view of human relations Such far reaching studies would have been impossible in the old home of the department but now in the new building—formerly as to its ground floor a set of stables and as to its upper floors carpenters' workshops—it had a habitation admirably adapted to its purpose With regard to the staff the services of Mr J B S Haldane as professor of genetics had been obtained His great knowledge of biochemistry would enable him to introduce into genetics those physiological conceptions which alone could lead to an understanding of hereditary transmission of structure Provision had also been made for the establishment of a professorship in comparative physiology The staff and equipment bade fair to be as complete as any zoologist could desire

THE LISTER INSTITUTE

A COMPREHENSIVE YEAR'S WORK

A wide range of subjects is dealt with in the thirty ninth annual report of the Lister Institute of Preventive Medicine, which was presented by the governing body at the annual general meeting During the past year virus studies have, as usual, occupied a large amount of attention

VACCINIA AND VARIOLA

It now seems well established that the elementary bodies in vaccinia lesions represent the actual virus agents Dr C R Amies has found that while pure suspensions of the elementary bodies of vaccinia were readily agglutinated by antivaccinial serum from man, monkey, and rabbit, the serum of patients convalescent from small pox failed to give any uniform agglutination The next step was to obtain a suspension of variola elementary bodies This was done by inoculating monkeys with two different strains of human variola virus—a virulent one obtained from Calcutta and a mild one taken from a typical case of alastrim in this country Suspensions of elementary bodies taken from the skin pulp of the inoculated animals were, it was found, agglutinated by the serum of patients convalescent from either the English or the Indian small pox, while antivaccinial serum obtained from rabbits either failed to produce agglutination of the variola bodies or did so to a lower titre than that given by a vaccinial suspension Cow-pox elementary bodies were agglutinated by the homologous antiserum and also by antivaccinial serum Human antivariola serum failed to agglutinate a suspension of these bodies, though a hyper immune antivariola serum obtained from monkeys which had had repeated infections of the virus, agglutinated the suspension to a fairly high titre

It would seem from other experiments that variola virus can be readily changed into a strain indistinguishable from vaccinia serologically The conclusion is, therefore, that variola and vaccinia are very closely related antigenically, the difference being quantitative rather than qualitative

VARICELLA, ETC

Dr Amies has confirmed the finding of elementary bodies in human varicella fluid Somewhat smaller than those of vaccinia-variola, they are present in enormous numbers in the clear fluid taken from early vesicles Suspensions of them are agglutinated specifically by convalescent chicken-pox serum while agglutinins have been demonstrated in the blood as early as the fifth day after the appearance of the eruption (As already pointed out in the *Journal* of May 27th the presence of elementary bodies has also been demonstrated in the expired air of

The Medical Insurance Agency

Insurance "Consultants" to the Medical Profession offer you Free and unbiased advice in solving the following problems:—

1 **All matters relating to Insurance**

2 **The Purchase and Upkeep of Motor Cars**

3 **Loans for Purchase of Medical Practices or Partnerships**

4 **Advantageous scheme for House Purchase at nominal rates of interest**

During the past 26 years the Agency has negotiated for members of the Medical Profession Life and Endowment Assurances, etc.,

exceeding £3,000,000

In various forms of Insurance the Agency has handled, in premiums,

over £1,000,000

The premium income on behalf of the Companies selected for 1932

exceeded £150,000

The above figures testify the trust placed in the Agency by the Medical Profession

WHICH EXISTS TO PROTECT YOUR INTERESTS AND SAVE YOUR MONEY

a patient in the early stages of chicken pox) It thus seems highly probable that the elementary bodies represent the actual aetiological agents

Other virus studies include the cultivation of vaccinia virus in cell free media and of louping ill virus *in vitro* The successive stages in the growth of the pleuropneumonia organism have again been studied by Professor Ledingham and it may shortly be possible to attack the problem of its systematic position

SEROLOGY

Serological studies include an examination of the antigenic constitution and immunizing properties of bacteria Dr T S Schütze is continuing his studies on the antigen concerned in the immunity conferred by anti plague vaccine After establishing the importance of the heat labile envelope antigen he is investigating methods for the best production of it and is endeavouring to determine whether the vaccine should be grown in a fluid or on a solid medium Dr A Felix has been studying the serological varieties of typhus with particular regard to the São Paulo endemic of this disease Dr J T Edwards has continued his work on foot and mouth disease He has been unable to demonstrate the existence of carriers after a search for the persistence of the virus in the urine or blood of guinea pigs which have recovered from an attack of the disease Observations on rats have shown that susceptibility is much influenced by diet

ENDOCRINOLOGY

Dr V Korenchevsky has been studying the action and assay of testicular hormone and the mechanism of action of vitamin A deficiency on various organs and functions The changes obtained by injection of testicular hormone in various conditions are recorded Experiments demonstrated a powerful influence on several organs and functions The anabolic properties of the hormone essential for the building of tissues and the growth of organs and animal were evidenced by increase in body weight and increase of weight in sexual organs thyroid liver and kidneys of the injected castrated rats The katabolic or disintegrating properties of the hormone were shown by the acceleration of thymus involution and by decrease in adrenal weight In this connexion the mechanism of the influence of vitamin A and its anabolic function were also investigated Paired feeding experiments were performed as a result of which vitamin A was shown to have in addition to an appetite producing principle an anabolic principle Both of these are essential for the building of tissues for increase in body weight and for growth of the animal

VITAMINS

Further work has been carried out with vitamin standardization Under the heading of Vitamin B Complex Dr H Chick Miss A M Copping and Miss H M Jackson have been unable apart from growth limitation to define any syndrome of factor Y deficiency This factor appears to be present in concentrates from brewers yeast Therapeutic trials with human cases have been carried out by Dr Lucy Wills with a series of tested fractions of the B complex It had already been found that marmite was effective in the cure of tropical macrocytic anaemia and pernicious anaemia of pregnancy Subsequently marmite with normal gastric juice was found effective in true Addison's anaemia a fact which suggested the possibility of the active fraction in this substance being identical with vitamin B Dr Wills's researches seem however to exclude any known fraction of the vitamin B complex as the active factor As regards the growth promoting and anti dermatitis functions of vitamin B_2 these two properties have now been shown to run parallel in a number of materials and to be equally affected by heat The relation between pellagra and wheat and maize still appears to be shrouded in mystery and no explanation is yet forthcoming as to why the disease should be associated with the consumption of maize rather than of wheat Miss E M Hume and Miss Henderson Smith studying carotene as a source of vitamin A have found that the solvent in which it is given is of considerable importance Coco-nut oil stands out easily as the best solvent

Antiscorbutic Principle

Dr Zilva has continued his investigations on the chemical nature of vitamin C As has already been stated in previous reports earlier attempts to isolate this substance from lemon juice have shown that active fractions possessed strong reducing properties Although there was some parallelism between the reducing capacity and the antiscorbutic potency this was not found to be the case in a great number of chemical fractions from lemon juice and it is still concluded that vitamin C and the reducing substance are not identical Further researches are however being pursued in this connexion A practical point emerges from experiments conducted on applying a low temperature to Bramley's seedling apples It was found that in the apples stored at −5° C the loss in vitamin C was very great in those stored at −10° C the loss was less but even then amounted to almost 50 per cent at −15° C there was a slight loss, and at −20° C no loss at all In these experiments the apples were stored for as long as seven months In another variety of apple King Edward VII the vitamin C content was considerably raised by lowering the nitrogen content of the fruit both by cultural methods and by barkringing the trees

OTHER STUDIES

The department for study and preparation of therapeutic serums has been concerned with the lethal action of Type I pneumococcus and with the titration of a Type I antiserum Drs Petrie and Morgan have assigned a provisional unit of protective value to the British Standard Serum by comparison with a standard liquid serum supplied by Dr Felton of Harvard The general results of experiments are as follows (1) The lethal power of a virulent test culture can be maintained within reasonably narrow limits and (2) the method which they have employed during the past three years allows of the titration of serums within reasonable limits of accuracy A horse has been immunized with a rough Type I pneumococcus Tested in mice the serum gave a slight but definite protection against the virulent Type I strain No evidence of reinforcement was found however when the serum was administered in conjunction with type specific serum The observation is of interest in indicating that the protective action of type specific serum in the mouse is directed almost exclusively against the capsular and not against the somatic component of the pneumococcus

Other researches include the isolation from Type I meningococcus of a polysaccharide substance which gives specific precipitation with the homologous precipitating serum at a dilution of 1 in 1 000 000 The characteristics of the endotoxin of the meningococcus have also been investigated The Institute is co-operating with the Medical Research Council and the Public Health Department of the L C C in the preparation of a serum for the treatment of poliomyelitis This is obtained from healthy donors who have suffered from the disease and is intended for use only in the preparalytic stage In the department of biochemistry Professor Robison and Dr Rosenheim have obtained interesting results in their study of the mechanism of ossification Dr Gulland has continued the work on the oxytocic hormone of the posterior lobe of the pituitary This hormone has not been isolated and financial as well as practical difficulties still stand in the way It is hoped however that investigation may eventually lead to the building up by synthetic chemistry of compounds which satisfy the experimental facts One interesting and useful aspect of these studies is the effect of proteolytic enzymes in destruction of the hormone

An indispensable book

ACTINOTHERAPY TECHNIQUE

An outline of indications and methods in the use of modern light therapy.

With foreword by Sir Henry Gauvain, M D, M Chir (Camb), F R C S (Eng)

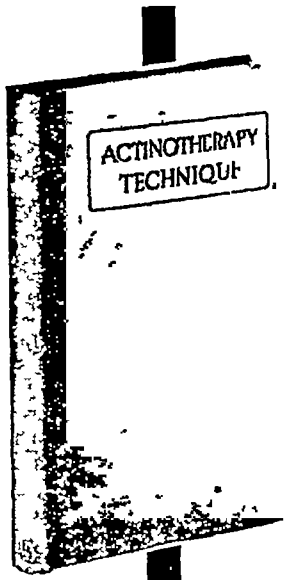
The Standard Edition

Eight years' work went into the making of this book, every known publication on actinotherapy was scrutinised From this material nearly 1,000 books and papers have been summarized into clear, concise instructions on technique The result is a crisp, practical working manual, alphabetically arranged for easy reference, fully annotated

The Foreword says "The compilers of this handbook have done their work with commendable thoroughness On behalf of my medical colleagues I thank them for having placed this valuable volume at our service I believe that it will be regarded as indispensable to all engaged in the practice of actinotherapy"

Standard Edition Bound full cloth 168 pp, illus.
6/- net (*by post* 6/6)
Of all booksellers or direct from

THE
SOLLUX
PUBLISHING CO.



Presentation Edition

To every registered medical user of British Hanovia Lamps we will present a free copy of the book here announced The special presentation edition, distinctively bound in full cloth, is now in press for early distribution

This offer is limited to members of the medical profession and qualified assistants It will apply to any present users of Hanovia equipment who may forward their names, and to those who may install Hanovia apparatus at any future date

Any practitioners for whom this offer has interest are invited to return the coupon below

The presentation edition will not be sold
It is obtainable only from

THE BRITISH
HANOVIA
QUARTZ LAMP CO. LTD.

SPA DEVELOPMENT AT HARROGATE

OPENING BY LORD HORDER OF A "SUN COLONNADE"

What was described as the first instalment of a "new Harrogate" was opened on June 17th by Lord Horder of Ashford. It takes the form of a delightful sun colonnade and other new buildings which add to the beauty of the spa and its amenities for visitors. For some years the corporation has had in mind the construction of a covered walk for the benefit of invalids so that on wet days they need no longer rest in the sulphurous atmosphere of the pump room. The project has now materialized in the shape of a colonnade, 600 feet in length, on the highest ridge of the familiar Valley Gardens. It is so situated as to obtain the maximum sunshine, and so built as to afford shelter from the occasional bleakness which reaches Harrogate from the Yorkshire moors. With a glazed roof and one open side, it is divided into three sections, enlarging at each division into a sun parlour or solarium. These sun parlours, fitted with 'vita' glass, heated electrically by wall and overhead panels, tastefully furnished, and decorated with palms and plants, are places where visitors may rest and enjoy the 'outdoors' feeling whatever the weather. At the end of the covered promenade, which, though built on high and uneven ground sloping downwards, is of the easiest gradient throughout, there is a large pavilion, with a big dome-light in electro copper glazing, of pleasant design and a veranda in front from which a view is obtained over a series of grass terraces and the rock garden. The cost of the completed portion of the scheme is £22,500, but the total project, which includes a general rearrangement in the neighbourhood of the old sulphur well and pump room, is expected to cost £60,000.

The Harrogate Corporation entertained as its guests nearly two hundred members of the medical profession from London and other centres. Those who came by special train from London were met on arrival by the mayor (Alderman Whiteoak) and the president of the Harrogate Medical Society (Dr. Laura Veale). The opening of the new buildings was made the occasion of a civic procession and other ceremonies, attended by the mayors of many Yorkshire towns. In handing to Lord Horder a gold key, Alderman Stott, the chairman of the Spa Development Committee, claimed for Harrogate a progressive spirit and a resolve to offer a "British cure for British people." He said that an entirely new and up to date pump room, close to the sulphur spring and worked in conjunction with the bathing establishment was envisaged. Lord Horder, who spoke as a friend and patron of Harrogate of many years' standing, said that the possibilities offered by the medicinal waters of this country were only beginning to be appreciated. Too long had we suffered the illusion that the rivers of Damascus were better than all the waters of Israel. If the tightening of purse strings had had no other good result it had at least constrained people to look at home for the means of health, and they had found that in the matter of spa treatment, at any rate the facilities were as good in Great Britain as they were abroad. But the provisions of Nature had to be made available and amenities must not be omitted. The influence of a beautiful and peaceful environment upon the promotion of health had never been more obvious, and this attempt by Harrogate to bring the gifts of design and adaptation to bear upon natural beauty was a recognition of that fact and a testimony to the wisdom of its authorities. Given, as in this case, the energetic and intelligent co-operation of the doctors, the municipal authorities and the townspeople, there was no reason why British spas should not be as successful and popular as their Continental rivals. Later in the afternoon the medical visitors were taken over the Royal Baths, members of the Harrogate Medical Society acting as guides. They were told that last year 120,000 various treatments were given, 86 per cent. of them under medical prescription. The number of different treatment methods is about one hundred, with the saline sulphur bath in various forms the most prominent. The peat mud bath is a relatively new introduction. The extent of the establishment was a surprise to many of the visitors, the staff employed numbers nearly 200.

The day ended with a banquet given by the corporation and the medical society and presided over by the mayor. The company was representative of the civic life of Yorkshire, the medical profession, and the press. The health of 'Harrogate, town and spa," was proposed by Major J. W. Hills, the member of Parliament for the division in which Harrogate is situated, who revealed the fact that free treatment at the baths is one of the perquisites of Harrogate's M.P. A reply was made by Dr. Wilfrid Edgecombe, who read an ode which he had composed many years ago on his first acquaintance with the Harrogate sulphur water. Dr. Edgecombe spoke of Harrogate's up-to-date pathological laboratory, its clinic for the investigation of disease, its Royal Bath Hospital with provision for spa treatment of necessitous patients, and its efficient organization for transfusion. The Royal Bath Hospital had, in conjunction with Leeds University, instituted a scheme for the appointment of a whole-time research worker, who would make his special subject the investigation of rheumatic disorders. Lord Horder, in his speech gave certain advice to spas, being careful to except Harrogate from any implied criticism. A complaint frequently made at British spas was that, although the doctors knew their job, the amenities of the place did not rank with those of Continental resorts. A second complaint was that bathing treatments cost too much; a third that not enough attention was paid by the hotels to special diets for patients, and a fourth that measures were not taken to put down noise, especially the noise arising from motor traffic. Lord Horder said that a resort might cater either for the seeker after health or for the hooligan, but it could hardly cater for both.

On Sunday morning the medical and other guests of the Corporation were taken to Fountains Abbey, where an address on the history of the abbey was given by Captain F. M. Sutherland. They then returned to London by special train.

OESTRUS-PRODUCING HORMONE

AN INTERNATIONAL STANDARD

The following statement has been prepared with the object of making known to all those interested that the international standard for the oestrus producing hormone, recently adopted by the Health Organization of the League of Nations, is now available for research workers, laboratories, and institutions in Great Britain and Ireland.

In July of last year a Conference was held in London under the auspices of the Permanent Commission on Biological Standardization of the Health Organization of the League of Nations, with the object of discussing the possibility of securing international agreement on standards of reference and units of activity for the sex hormones. While the Conference agreed that knowledge of the male sex hormone and of the hormones of the corpus luteum and of the anterior pituitary body is at present sufficiently advanced to permit of a standard of reference being established and a unit of activity defined for these substances, important decisions were reached in regard to the oestrus producing hormone. This hormone has been prepared in pure crystalline form from the urine of pregnancy in quantities sufficient to admit of chemical examination; it exists in two forms—a ketohydroxy form and a trihydroxy form—the first named being the more active by the ordinary methods of testing in producing oestrus in animals subjected to oöphorectomy.

The oestrus producing hormone has been the subject of extensive investigations in recent years and a state of confusion was developing in consequence of the adoption of different "units." As in the case of other substances exhibiting marked and specific biological activity attempts to define units in terms of animal reaction had only served to show that units defined on such a basis lacked uniformity, the unit varied not only from one species of animal to another but in the same species, was dependent upon the method of

administration and the method chosen for interpreting the result of the administration of the hormone

The Conference agreed that as in other similar cases the only safe basis for international agreement on a unit was the adoption of a standard substance in terms of which the unit could be defined The standard adopted by the Conference for international use is a quantity of the ketohydroxy form of the hormone in pure crystalline condition which is preserved at the National Institute for Medical Research London and the unit of activity is defined as the specific oestrus producing activity contained in 0 1 γ (= 0 0001 mg) of this standard preparation

In order to provide an adequate amount of material to serve as an international standard different countries have sent samples of the pure crystalline ketohydroxy form of the oestrus producing hormone to the National Institute for Medical Research London (acting for this purpose as the central laboratory on behalf of the Health Organization of the League of Nations) where the final preparation of the standard has been completed and arrangements have been made for the storage of the standard and for its dispatch to the central laboratories and institutions in other countries which have been nominated by the Health Organization of the League of Nations for local distribution

Institutions or individual investigators in Great Britain and Ireland requiring the standard for the oestrus producing hormone should apply to the Department of Biological Standards the National Institute for Medical Research Hampstead N W 3

INTERNATIONAL OPHTHALMIC CONGRESS IN MADRID

The fourteenth Concilium Ophthalmologicum was held in Madrid from April 16th to 22nd and was attended by numerous delegates from about forty countries At the first session inaugural addresses were delivered by the President of the Spanish Republic Professor van der Hoeksve (president of the International Council of Ophthalmology) and Professor M Márquez (president of the congress) who also read a message of greeting from the veteran Professor Ramon y Cajal Sir John Parsons on behalf of Great Britain and delegates from other parts of the world followed with official expressions of congratulation and good wishes

The first of the main topics for discussion—namely tuberculosis of the iris and ciliary body—was introduced by Dr E V L Brown of Chicago who criticized the failure in practice of such modern lines of local therapy as the use of x rays and the introduction of the patient's own blood into his anterior chamber Tuberculin had not been shown to prevent recurrences nor attacks in the other eye nor did it seem to influence favourably the intrathoracic infection Open air rest dieting and the promotion of a feeling of confidence would often cure the lesion Dr Igersheimer of Frankfort dealt with the pathological anatomy of this manifestation of tuberculosis and suggested a basis for classification The characteristic differences between the acute subacute and chronic recurrent types were he said attributable conceivably to immuno-biological conditions The third speaker Dr H Lagrange of Paris devoted his address to the recognition of this form of tuberculosis and its differential diagnosis—a matter of especial importance in the presence of diffuse and anodular iritis or iridocyclitis In the absence of any direct indications of focal infections and syphilis the diagnosis could be only a statement of probability since no special clinical signs had yet been defined The therapeutical test with tuberculin afforded the most dependable criterion The second main topic for discussion was retinal detachment This was introduced by Dr H Arruga of Barcelona who critically reviewed the aetiology and pathology paying special attention to the theories relating to choroidal exudation and vitreous shrinking He considered that the idiopathic form in the vast majority of instances was due to retinal lesions The medical treatment of the disease was reviewed by Professor G Ovio of Rome the principal lines being keeping the patient at rest in the dark diaphoresis the instillation of eserine or atropine electrolysis massage preparations of iodine subconjunctival and intravitreous injections and other means such as mercury adrenaline tuberculin and a salt free diet Operative treatment for the closure of the retinal hole was considered in detail by Professor A Vogt of Zürich Various methods were compared and the simpler procedures—ignipuncture with the galvanocautery and diathermy—were held to be likely to become the most popular Special advantages in certain circumstances were possessed however by each of the other lines of intervention Cauterization it was added might be dangerous if too prolonged

With commendable rapidity these valuable addresses have now been published in full in two volumes fully documented and excellently illustrated A third volume contains the contributions made during a session on trachoma in which the progress of the campaign against it in various countries was described One attractive feature of the congress was the publication each day of a bulletin this summarized the proceedings of the previous day and announced details of the programmes of the current and following days As a souvenir an album of the names descriptions and photographs of those taking part in the congress was prepared and distributed

ROCKEFELLER MEDICAL FELLOWSHIPS

The Medical Research Council announces that on behalf of the Rockefeller Foundation it has made the following awards of travelling Fellowships for the academic year 1933–4 These Fellowships are awarded to graduates who have had some training in research work either in the primary sciences of medicine or in clinical medicine and surgery and who are likely to profit by a period of work at a chosen centre in America or in special cases in Europe before taking up positions for higher teaching or research in the British Isles

Hospital Conference at Bath

Bath maintained her well-earned reputation of ideal hostess when the British Hospitals Association and the Incorporated Association of Hospital Officers held their annual conference there on June 8th 9th and 10th There was a large attendance and papers of interest were read and discussed Under the chairmanship of Sir Harold Pinl the council reported that the membership was now 1 300 and that 640 hospitals were associated The first paper was by Mr G T Whiteley (King's College Hospital) on pay beds in hospitals He mentioned that there were no 1 680 pay beds in London but this was not enough to supply the demand in his opinion the best system was the separate block and the time would come when the general practitioner would be allowed to attend his patients in hospital Dr C E S Flemming said that pay beds would enable the general practitioner to attend some of his patients in hospital it was important to himself and to the public for him to have the advantage of an institution The young medical man of to-day inherited a vast fortune of scientific and technical knowledge but in practice he was disheartened to find that he was so often unable to use that knowledge for the benefit of his patients The Royal United Hospital Bath had to some extent met the difficulty for it had associated with it the Forbes Fraser Hospital a pay bed hospital of 72 beds which was used by general practitioners as well as by specialists Mr C H Terry Bath

read a paper on the institutional treatment of adult cases of surgical tuberculosis He prefaced it by well chosen words on the importance of friendly co operation between the administrative and medical staffs of voluntary hospitals He advocated special wards and special hospitals for the treatment of these cases, which occupied the ordinary beds for an undue length of time On Friday, June 9th, interesting papers were read by Mr Rowse Mitchell (Chester Royal Infirmary) and Mr C M Power (Westminster Hospital), on hospital systems and administration in other countries, and on the Road Traffic Act Saturday morning was occupied by a debate on "The Area Problem of the Contributory Schemes," but this was, in fact, a discussion of the policy of the Hospital Saving Association The subject was set out in a report dealing with the negotiations between the British Hospitals Association and the H S A regarding the difficulty that had arisen with certain provincial hospitals This report only came into the hands of the members at the beginning of the meeting Part of the report, issued at the invitation of the British Hospitals Contributory Schemes Association, stated the policy of the H S A and the method by which it proposed to meet the difficulty that had arisen The report also included a memorandum of the B H A with recommendations for the consideration of the meeting There was a long discussion, in which was pointed out the injury that would be done to local contributory schemes if an opposition scheme was set up in the same area There was obviously a strong feeling against the action of the Hospitals Association, on the other hand, there were those who, like Mr Lamb, thought that the B H A had been more sinned against than sinning Dr Flemming said that the solution of the difficulty was to ensure that in every area there was a satisfactory contributory scheme, and that these schemes were properly co-ordinated and reciprocated, that the voluntary hospitals were now so dependent on contributory schemes that their supporters could not afford to be divided, and he proposed that the council of the B H A be requested, in conference with the Contributory Schemes Association, to formulate a proposal to solve the present area difficulty Another proposal, moved by Mr Stamford Hutton of Gloucester, that the recommendations in the report of the council be endorsed, was put first, and agreed to The original motion was dropped, and it was left to the council to take the course it considered best

There are many medical members of the British Hospitals Association, and it is a pity that more of them do not attend the annual meetings Their contribution to the discussions would often be of value, and for them to meet with the administrators of the hospitals on mutual ground and in free debate would be instructive to both sides, and help to advance that friendly co-operation which is so much desired

International Congress of Urology

The International Society of Urology, which, as previously announced in these columns, is holding its fifth annual congress in London from July 10th to 15th, was founded in 1919 Previous congresses took place in Paris in 1921 in Rome in 1924, in Brussels in 1927, and in Madrid in 1930 Nearly every nation is represented in the society, but the number of members allotted to each nation is strictly limited Only members may take part in the congresses At the coming one the president is Sir John Thomson Walker, and the vice-presidents are Professors Leon Kogen of Belgrade and P N Hansen of Copenhagen The first day will be devoted to business, but the president will give a reception in the evening at the Dorchester Hotel, Park Lane On Tuesday July 11th, Prince Arthur of Connaught will formally open the congress at the Royal Society of Medicine This will be followed by a discussion on tumours of the renal pelvis and ureter, initiated by Professors Salvador Pascual of Madrid and F Van den Branden of Brussels and Mr Swift Joly The discussion will continue through the afternoon In the evening the President and Council of the Royal College of Surgeons will hold a reception at the College in Lincoln's Inn Fields The morning and afternoon of July 12th will be devoted to the consideration of pyelography by the descending route, the opening speakers being Professor von Lichtenberg of Berlin and C Ravasini of Trieste, and Mr R Ogier Ward A banquet will be given in the evening by the British section in Merchant Taylors Hall The surgery of the neck of the bladder will be the topic for discussion on July 13th, it will be introduced by Professors G Marion of Paris and J Weijtland of Amsterdam, and Mr Kenneth Walker In the afternoon there will be a reception by the Lord Mayor at the Mansion House, and another by the Government in the evening at the London Museum Friday, July 14th, will be spent in a visit to Oxford On the final day of the congress there will be a general assembly at the Royal Society of Medicine, followed by the reading of independent papers, including one by Dr Edwin Beer of New York, on the value of ureteral reimplantation in the bladder Further details are obtainable from Mr J Swift Joly, F R C S, 80, Harley Street, W 1, who is secretary of the congress

The Wrightington Hospital

On May 10th members of the Lancashire and Cheshire Branch of the British Medical Association had the opportunity of visiting the Wrightington Hospital, near Wigan The hospital, which exists for the treatment of tuberculous disease, contains 226 beds, of which 126, housed in three one-story pavilions, are for adults, 92, in two one story pavilions, for non-pulmonary cases among children, and 8 comprise an isolation block For "dispensary" purposes Lancashire is divided into five large areas (average population, 320,000 each) and three sub areas Each large area is under a consultant tuberculosis officer, with a staff of assistants and health visitors The officers also do hospital work, and the medical superintendents undertake some dispensary work—for example, the medical superintendent of the Wrightington Hospital is responsible for the dispensary work in the Wigan county sub area The Lancashire County Council's scheme provides for the treatment of tuberculosis—pulmonary, non pulmonary, and mixed Dispensary registers at the end of 1932 showed 4,357 pulmonary and 3,531 non pulmonary cases Cases of actual or suspected tuberculosis are referred to the tuberculosis officers at the dispensaries, who recommend treatment at appropriate institutions—lung cases at sanatoriums and pulmonary hospitals, and surgical cases at special (for example, Wrightington) and general hospitals Pulmonary cases occupy 689 beds, non pulmonary 301 Modern methods of treatment of non pulmonary tuberculosis in the county show that of 2,600 patients treated for this condition during the years 1920–4, 75 per cent have now recovered or have the disease quiescent

National Baby Week

Since its inauguration in 1917 Baby Week has been celebrated annually, and the seventeenth of the series will continue from July 1st to 7th It is proposed to concentrate special attention this year on the ways and means of preparation for parenthood and on the furtherance of the aims and objects of the Central Union of Fathers' Councils, with the intent to promote the formation of more "fathers' committees" at infant welfare

RIPE FRUIT for HEALTH

Guy's Hospital Gazette states

The value of lemon juice is well known as a blood cleanser and a strengthener of the gastric juices It is excellent in cases of Gout Rheumatism and all allied disorders also in Catarrh, Influenza etc.

When you prescribe fruit juice, do you know the conditions under which the fruit is grown, plucked, packed, shipped and unpacked, or through whose hands it passes before the juice is finally squeezed from it?

Our Lemon and Orange Juices are expressed in Sicily from selected sun ripened fruit The Lemon Juice is available in undiluted form, or sweetened with pure cane sugar or honey

We bottle only the natural juices of ripe fruits

Our Grape Juice is expressed from choice Italian grapes

These juices are superior to the raw fruits There is no waste or loss through deterioration Price and quality are constant Clean and convenient to handle they are available in containers to suit all purposes

Ask for PURITY' BRAND LEMON ORANGE, or GRAPE JUICE.

Supplied to Hospitals Nursing Homes, private medical practitioners and stocked by Chemists Health Food Stores and Grocers throughout the country

THE QUANTITATIVE CONTROL OF THE DIET IN DIABETES MELLITUS

required by modern treatment with or without insulin can only be carried out efficiently by the use of standardised foods especially those containing carbohydrate

CHELTINE FOODS AND BREADS meet every possible requirement in this respect They have been famous for their palatability for 40 years and without losing that important character have now been brought into line with existing medical demands They are of guaranteed composition and on every package there is an analysis of the contents showing their Carbohydrate, Protein, Fat, and Caloric values

CHELTINE FOODS AND BREADS are manufactured under the direction of a medical expert and their composition is controlled by an analytical chemist They offer a wide range of choice suited to every form of the disease mild or severe and avoid monotony in the diet and are all hygienically packed to protect them from deterioration and avoid contamination

CHELTINE BREAD the most palatable Diabetic Bread on the market contains approximately fifty per cent less carbohydrate than average household bread It is sold in loaves containing 100 grams or 50 grams of carbohydrate to facilitate accurate use in differing types of cases and can be baked at home or by bakers according to instructions or supplied direct by

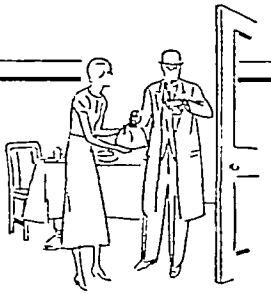
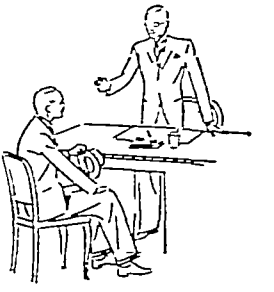
To a doctor's wife



OF all married women, yours is perhaps the most difficult task Your husband may be the soul of consideration, but his patients certainly are not Any hour of the day or night he is at their beck and call—consultations here, visits there Likely as not, when he seems to have a quiet hour or two for dinner, the 'phone rings and in ten minutes' time the car is at the door and he's away again

How *can* you cater for people like that? It's difficult Of course, a Frigidaire would help you Help you in this way If he didn't have time for a proper hot dinner, there would always be a cold snack in the Frigidaire against his return

And such tempting cold snacks, too; delicious new savouries and entrees ice cream crisp, cold salads and chilled beer or mineral water ice cubes if he feels like a long cold drink And you would have the joy of knowing that every bit of food that he ate was perfectly fresh, all its natural goodness preserved by Frigidaire's crisp, never-failing cold



Every day he is lecturing his patients about health, he's probably far more careless about his own It's up to you—the doctor's wife—to take care of it And as far as food is concerned, Frigidaire takes all the responsibility off your shoulders It keeps good food good

Frigidaire is very inexpensive to own when you consider the service it gives, and the ease with which you can acquire one A postcard to our Bond Street Showrooms will bring full particulars

centres throughout the Empire It is hoped that these subjects will find place in local and national propaganda programmes for treatment in lectures discussions articles in the Press and in sermons A conference on maternity and child welfare organized by the National Association for the Prevention of Infant Mortality is to be held at the Friends House Euston Road N W on July 5th to 7th Mr A M Hendry assistant surgeon to the Shropshire Orthopaedic Hospital will speak on team work in the discovery of the cripple Dr W A Bullough county medical officer of health for Essex will discuss the possibilities of propaganda in rural areas Dr E H T Nash medical officer of health for Heston and Isleworth will indicate ways and means of propaganda with special reference to immunization and Dr Harold Waller will deal with the diet of the child after the period of milk feeding In connexion with this conference visits are being arranged to child welfare institutions of different kinds During the whole week there will be displays of propaganda films in London Further details of these and other information may be obtained from the offices of the National Baby Week Council 117 Piccadilly W

Scotland

Dundee Royal Infirmary

The annual meeting of Dundee Royal Infirmary was held on June 12th Mr D A Anderson presiding The main feature of the meeting was the statement by the chairman that the reserve funds of the institution were now exhausted through the writing-off for some years past of the deficits in the annual accounts The hospital had been working at a loss of £10 000 per annum and this gulf between income and expenditure must be bridged if the hospital was to continue to provide the same service as before An appeal had been made last March both to employed persons and to employers of labour for the organization of regular weekly or monthly contributions This appeal had met with a response in a few instances but in the majority of cases nothing had been done so far There was still time before the end of the financial year to rescue the Royal Infirmary from this position but unless either employers or employees rose to the occasion the services of the hospital would have to be curtailed Something definite and regular in the way of income was essential in the future

Maternal Mortality

The sixteenth annual meeting of the Scottish Midwives Association was held at Hamilton on June 10th when a civic reception was given by Provost Andrew Brown and the magistrates Mrs Millar Glasgow occupied the chair and Dr J Hume Paterson medical officer of health for the county of Lanark delivered an address in the course of which he said that measures were being taken by local authorities to frustrate attempts at midwifery work by unqualified persons In Lanarkshire such unauthorized practice had almost ceased It was a tragic feature of the social life of the country that despite the recent advances in the attention which was given to the health of expectant and nursing mothers the maternal death rate had shown practically no improvement There had however been a decline in 1931 which was very satisfactory An analysis of 248 maternal deaths in Edinburgh during the years 1924–8 had shown that the death rate among mothers who had had no prenatal supervision was twice as great as among those who had received this supervision

Ireland

Public Services (Temporary Economies) Bill

In the recent debate in the Dail on the Public Services (Temporary Economies) Bill Mr P McGilligan (National University) moved an amendment to exclude medical officers in the services of local authorities from the scope of the Bill There could he said be no question that this measure was intended to apply to medical officers or that as drafted it carried out that intention The medical men affected by the Bill had met to consider their present position under the local authorities and the adverse change which would be made if the measure went through The meeting had been given a certain amount of publicity in the Press and a memorandum had been circulated he thought to all deputies of the House In that memorandum they dealt with the various sections of the medical profession attached to local authorities the county medical officers of health and their assistants medical officers in the mental hospital service county hospital surgeons and finally the Poor Law medical officers or as they were better known the dispensary medical officers He had asked previously whether it was intended to cut the fees for the registration of births deaths and marriages and the fees in relation to the Vaccination Acts the only satisfaction he had received was to be told that these fees were to be cut though there was some dispute as to whether they would be cut under Part II or Part III of the Bill However the doctors made their case apart from the distinction of the groups into which they divided themselves They said that their position differed from that of other people affected by the Bill such as lay civil servants Civic Guards school teachers and so on They were members of a learned profession—that is they had been required to spend many years of study in order to equip themselves even technically for the posts they held These posts required rather specialized qualifications and the ordinary doctor who did not become qualified until he was somewhere between 22 and 23 years of age could not get any experience which would be counted sufficient for them In addition he had to have considerable experience of a post-graduate type and it was now generally required that those appointed to public positions should have the Diploma in Public Health That again entailed special study and meant that a medical man had to attain that position in which he could leave his practice to study in Dublin or in one of the other university colleges for the diploma It was no small thing to ask a young man who had just entered the profession to do this Not only was this diploma necessary but the struggle for public appointments was so great that applicants required also to have had considerable experience in actual public health work This meant a visit to England or the Continent to acquire an experience in some way related to the work or the activities they would afterwards have to perform and a consequent postponement of the date on which they could be ready to make application Moreover it was unusual for a medical man to succeed on his first application The result was that when he did secure an appointment he entered the public service at a much later age than say lay members of the civil service and the period to which he had to look forward for the purpose of making savings or securing a pension was very short This made it all the more necessary that he should save substantially before taking up any of these posts

The medical teachers in the university—and Mr McGilligan presumed that they came under this also—had to be specially commented upon It had been recognized everywhere that their salaries had been cut as far as

they could be The universities, whose financial resources had been somewhat cramped, had not been liberal towards anybody who could be described as a part-time teacher, and medical men were among that group It was not possible to save out of what they received from the university These men needed a certain amount of leisure They nearly all had the work of an outside practice to add to that of teaching and examining If without adequate leisure neither their teaching nor their professional work would be up to the standard expected of them If the emoluments from university chairs were insufficient to pay a professional man for the loss of his time the best men would not offer themselves for appointment, and those instructing the youth of the country would not be those from whom the best medical knowledge could be derived The county medical officers of health constituted one of the newest of the medical services It was definitely laid down with regard to these posts that in order to be qualified a man must hold a D P H after completing a two years' course The only place where he could get the necessary training in administrative work was still England, or the Continent Having secured an appointment in England, he was induced to resign, surrendering promotion chances and pension rights, and to take up a position in the Free State, where the salaries were much smaller, and where, it could also be said, the work was harder in the sense that there were probably more cases brought under a doctor's notice It could be readily seen why these salaries were fixed on a low scale Anybody who looked back on the time, not so long ago, when these positions were established would remember that the county boards of health did not, at the start, favourably receive them In order to gild the pill as much as possible for the local authorities who had to foot the bill the salaries were scaled down in an extraordinary way The officers who first took up the appointments were told that if they were successful in their work, and if they succeeded in impressing on the minds of the people in the locality that their work was of benefit, then they could count upon a betterment of their conditions and particularly, upon a rise in their pay It was now proposed to have the salaries of these men cut still further When the salary was first fixed there was an association of county medical officers of health After meeting and discussing the matter they passed a recommendation to the effect that £800 should be regarded as the minimum at which any one of them should take up the work The scale was then fixed The county medical officers of health had assistants, and whatever was said about the medical officers themselves applied with much greater force to the assistants Their present salaries were far too small to permit any deduction The work they were engaged on was mainly connected with tuberculosis and the inspection of school children and school clinics work which had always been regarded as of the utmost importance The assistants, however, were paid at scandalously low rates, which it was proposed further to reduce Those in the mental hospital service had been suffering from a peculiar disadvantage for years past Their salaries had always been regarded as very low in comparison with those paid in England and the allowances they received which counted for pension purposes, were also rated very much lower The people who secured those positions did so at a relatively late period The peculiarity of the new situation was that under the Local Appointments Commissioners it was a rarity—if, indeed, it had ever happened—for one of the senior medical officers in the asylum to secure any of the better appointments Invariably the younger men obtained the posts and the older men were left to follow along as before The surgeons in county hospitals were also paid on a very low scale for years they had been agitating for a betterment in their conditions Their grievance had been that they were supposed to be specialists in certain work, and yet they received rates which would be offered to very junior people going into practice for the first time These county hospital surgeons had to be expert so far as surgery of the eye, the ear, the nose, and throat was concerned, they had also to be expert in abdominal surgery In recent years they had been asked to undertake x-ray and pathological work Notwithstanding all this, there had not been any change for the better in their salaries Now it was proposed to reduce their poor emoluments In regard to the salaries of dispensary doctors these had been the subject, he supposed, of meeting after meeting, agitation after agitation, and of many deputations to the Government The salary started at £175, rising to a maximum of £300, in some instances it started a little higher, and in exceptional cases it rose to £350 a year, but that maximum included out of pocket expenses As far as the present depression was concerned doctors had got to the point of admitting that they would rather not get a call from a private patient Even Ministers themselves knew that there was a special case to be made for dispensary medical officers

Professor J M O'Sullivan (Kerry) said he wanted to stress one particular case put forward by Deputy McGilligan—the case of the dispensary doctor Anyone connected with the establishment of the public health services knew that the salaries of the county medical officers of health were fixed as low as possible owing to the great difficulty in getting a number of county councils to have them at all They were really calling upon men to do very expert work and not paying them properly He asked the House to consider how these dispensary doctors were hit at present, in the first place by the increased income tax, and in the second because they were getting no payment for private practice

The amendment was defeated

CORRESPONDENCE

Unqualified Medical Practice and the Medical Curriculum

SIR,—Certain recent legal decisions and dicta seem to foreshadow a new orientation of unqualified to qualified medical practice, the tendency of which is to reduce to vanishing point the differentiation between "registered" and "unregistered" medical practitioners In the present state of the law any person, whether he has had any professional training or not, can assume the titles of "physician," "surgeon," "medical practitioner," "doctor," and can practise medicine with impunity so long as he does not claim to be a "*registered* medical practitioner" This single restriction on his freedom, meagre as it is, is rendered largely nugatory by the circumstance that considerable sections of persons although "unqualified" now claim to be "registered" the 'registration" being by unofficial corporations with no statutory status such as is possessed by the body dealing with "registered medical practitioners"

The object of the Medical Acts (which was not to prevent unqualified practice but to distinguish clearly in the interests of the public those who had had an accredited professional training from those who had not) has been thus practically defeated It follows inevitably from these facts that in the public mind there is very little distinction between 'registered" and "unregistered" medical practitioners the prejudice being often in favour of the latter group But there is notwithstanding this prevalent feeling still a very real and important difference To secure the lowest registrable medical qualifica

DISTRIBUTORS OF DETENSYL, TAXOL, BOTOL, etc., etc., etc.

tion students (1) must give evidence of a general education of matriculation standard (2) must spend a minimum period of five and a half to six years in subjects of professional study prescribed and regulated by a statutory body at institutions sanctioned by an impartial inspectorate (3) must pass a series of examinations which are also inspected and supervised by the same statutory body the requirements of which progressively increase with the inevitable result that the duration of preparation also rises None of these conditions obtain in the case of unregistered practitioners The expense of this prolonged preparation for registration has become so onerous that for the past twenty five years the State has been called upon to subsidize ever more heavily the medical education which leads to registration The grant made by the State for this medical education now bears a proportion to its actual cost which varies from an average of 40 per cent at a general medical school to 80 per cent or even more in the case of some special schools The aggregate public expenditure thus incurred is a very serious and growing burden upon the community already so grossly overtaxed Furthermore the cost in money and effort to the individual student seeking to become a registered medical practitioner must be added to the ever mounting sacrifice which registration entails

If then the ultimate product of this very expensive education differs so little (in public estimation at any rate) from the product of methods of preparation which may not involve a tithe of that cost in money and effort it may not perhaps be worth while either on the part of the public or of the profession to persist in that production In point of fact the dissatisfaction among both teachers and students with the curriculum now required for registration has become acute At a very fully attended meeting of St Mary s Hospital Medical Society held on May 19th 1932 the following resolution was passed by a large majority That the present system of medical education does not produce an efficient practitioner Again at a recent meeting of the Students Union of Edinburgh University after a discussion opened by Dr Chalmers Watson a still more sweeping resolution was passed with only seven dissentients in a very large assembly

That this house places on record its opinion that the present system of medical education in this country is unsatisfactory In its opinion important changes in the curriculum are essential whereby more facilities for instruction in practical medicine are available and more assistance given in the principles and practices of preventive medicine The time required for this additional teaching can in its opinion be obtained by a judicious modification of the teaching in the earlier scientific subjects with some revision of the time and attention devoted to the teaching in the specials department of medicine and surgery —*The Student* June 2nd 1933

At the present moment a committee initiated by the University of London and comprising representatives from all the qualifying bodies which examine students educated in the London medical schools is sitting to offer suggestions for dealing with that dissatisfaction In an admirable address given at St George s Hospital last October by Dr Le Fleming Chairman of the Representative Body of the British Medical Association a very weighty plea was made for a quite different curriculum suited to the needs of general practitioners who form such an enormously large majority of the profession It is clear that a movement in the direction of establishing a much shorter and simpler curriculum better designed for fitting the average general practitioner for the work he has to do than the present overloaded course which would seem to have as its goal the production of specialists rather than of general practitioners is gaining ground rapidly and it is significant that the British Medical Association has instituted its own committee for investigating this question from the point of view of the general practitioner I suggest that in this movement may be found a possible solution of the present position unsatisfactory alike to registered and to the better class of unregistered practitioners

It must surely be obvious that any person claiming to treat disease and to be paid for doing so should be required to have had some training the value and scope of which can be attested by an impartial inspectorate operating in this country [The Osteopaths Bill at present before Parliament seeks to put on an equal footing with British qualifications foreign courses of study and foreign diplomas the standard of which is incapable of assessment in this country] That essential training must provide some acquaintance with the functions and framework of the body some experience of disease as an entity some initiation into the principles of preventive medicine and public health work wholly neglected by the present curriculum some expert knowledge of how to use material required in medical and surgical treatment Such preparation would probably call for something like four years study tested by examinations of an appreciably more restricted scope than is enforced at present for the minimal registrable qualification and should be compulsory for *all* persons desiring to practise medicine or surgery whether proceeding to registration or not This minimal training would be sufficient in the opinion of many expert authorities to afford a safe entrance upon the general practice of medicine and surgery and should be awarded registration under the Medical Acts I have sketched in outline the general principles of such a curriculum in an address given last October and published in the *Journal of State Medicine* in February 1933 The more ambitious man who wished to take a university degree in medicine or to qualify himself for any particular specialism or for research work or for holding an appointment at a teaching hospital would follow further courses of study as a post graduate student The complexity of modern medicine is such that it is quite impossible any longer to pursue the ideal hitherto seemingly cherished by medical schools and examining bodies that a student before qualification must possess some knowledge of every branch of medicine and surgery both general and special Under the present dispensation and even with a constantly increased period of study all that can be imparted is a very inadequate smattering of any particular item and the knowledge of the three essential subjects for qualification—general medicine general surgery and midwifery—has as examiners are everywhere complaining also become dangerously superficial

Whatever may be the solution ultimately adopted I hope I have made it clear that it is high time in the interests both of the public and of the profession to overhaul our present practice —I am etc

House of Commons June 9th

Transitory Arthritis of the Hip in Children

SIR —Mr R W Butler s interesting paper in your issue of June 3rd (p 951) is of special value in drawing attention to the large proportion of non tuberculous affections of the hip joint in childhood as compared with the number of true tuberculous cases The pathology of the type of case aptly termed by Mr Butler observation hip is obscure as suggested by him it is probably that such cases occur as the result of several diverse pathological processes Of recent years I have been led to believe that some of the cases are a sequel of a mild and aberrant attack of encephalitis lethargica These have occurred with greater frequency at periods when epidemics of this has been prevalent and in several of my cases there has been a history of disturbances of sleep alteration of

disposition, and the like The local symptoms have been marked by muscular spasm in the neighbourhood of the hip sometimes associated with a spasmodic posture of the lower part of the spine resembling hysteria I notice that two of Mr Butler's cases presented hysterical postures In my cases the posture was more consistent than is usual in hysteria , in one case definite mental changes subsequently showed themselves Other special features were abduction or inversion of the hip-joint greatly disproportionate to the severity of the other symptoms

It is difficult to form a definite opinion as to the part played by encephalitis in these cases, because the acute phase of that disease in young subjects may be in the highest degree insidious, and may even pass unnoticed It would therefore appear desirable that in all cases of " observation hip " careful inquiry should be made as to preceding symptoms, such as disturbance of sleep, transient diplopia, clonic movements, or alteration in disposition —I am, etc ,

Sheffield June 15th R G ABERCROMBIE, M D

"New Treatments for Old"

SIR —I should like to endorse very heartily the sentiments of the letter written by Dr W F Lloyd (June 10th p 1024) Being a general practitioner of some twenty-seven years' standing, and during that period having tried very many new drugs for the ever-recurring everyday ailments, I have learnt a wholesome spirit of scepticism, but that does not deter me from welcoming some of these which have rendered me Trojan service Among the latter are two whose merits are now under discussion—namely antibacsyn or its equivalent edenwil, and S U P 36 We should, of course, keep careful case records and statistics but even these may be misleading in epidemics such as influenza, which vary so much in severity We do, however, accumulate evidence of the value of a remedy—which to my mind is more convincing than statistics—from certain individual cases, that is, patients who have also acquired a wholesome scepticism from the recurring nature of their maladies May I give an example of this type of evidence

A woman of 45 stout and slightly inclined to be glycosuric has been attended by me for many years Every spring she is afflicted by carbuncles on the back which usually keep her in bed for about three weeks I have tried all the usual treatments and up to three years ago had most success with injections of manganese butyrate For the last three years I have given injections of edenwil or antibacsyn She never calls me in until the carbuncle is well developed but not discharging and her temperature about 101° F She now insists on having this remedy and tells me that after an injection of 2 c cm in the morning she always applies a double dressing that night knowing that there will be a very copious discharge The temperature will be normal in the morning, and her time of recovery is now limited to one week from the time of the first injection Neither the patient nor I have any doubt about the efficacy of the drug in her case The local treatment has always been the same—namely ung hyd nit dil There is but little scope for faith cure in this type of case I have never had to incise a carbuncle or boil since using this treatment and must have employed it in scores of cases also recurrences are very rare if three doses have been given ,

Then again, with another of these remedies so much mistrusted by Lord Horder—S U P 36 After a trial of over four years this seems to me invaluable in certain cases often of a dangerous character The firm producing the drug complained some years ago that it was brought into disrepute by practitioners who used it in conditions for which it was unsuitable While no panacea, to my mind it is invaluable in certain cases Some individuals are refractory to it, but to these it does no harm and I hope gradually to recognize the types which do not respond It is invaluable in all bronchopneumonias of children, and will never fail to produce the measles rash in a case where it is sometimes desirable to do so—that is, if the child is really ill, with a high temperature, is bronchial, and the rash delayed The whole condition is wonderfully improved twenty hours later at most

With influenza we can again sometimes get the evidence from the patient himself There is the class of patient who gets influenza regularly every year throws it off with difficulty, and remains feeble and often depressed for some time afterwards After treatment with S U P 36, given early in the case, many of these patients have volunteered the information that the after effects of their attack, and especially the depression, have been much lessened One does like to have a reason for the faith that is in one, and from this point of view I have studied three volumes of McDonagh's work *The Nature of Disease*, and tried to understand the theory of the action of the S U P 's and other remedies This proves very interesting, but mainly beyond my grasp

We general practitioners get very tired of treating these common maladies with the same old remedies, which we know to be only palliative *Plus ça change plus ça reste la même chose* Intelligent patients are fully aware of this, and many treat themselves for recurring troubles, using the prescriptions we have given them for years —I am, etc ,

Oxford June 10th D C NASMYTH

SIR,—I am surprised at the depth and extent of the therapeutic pessimism displayed in this correspondence so far For Dr Lloyd and those who think with him one can only " shed a bitter tear " and marvel at their courage in taking any food to appease their hunger when " the constitution of the molecules of proteins, hormones, vitamins etc , is so obscure "

Dr Julian's letter to-day is of a different class He has studied the working of the mind He has also apparently studied our profession, and come to the simple conclusion that we are all gullible fools For he would have us believe that the " master key " in the treatment of influenza and furunculosis is suggestion Now my mother has told me that when a child her warts were charmed away by a genial uncle, but I am perfectly sure that if Dr Julian had a bad attack of influenza, or a boil on the buttock, he would need something stronger than charms and suggestion before he felt that his condition had been adequately treated

I must confess that there seems something strange in the implications of Dr Julian's letter that I, who have been entranced for hours watching and hearing the great " J J " lecture in the Cavendish Laboratory, who have sat at the feet of both Allbutt and Rolleston, that I and thousands like me should be considered absolutely ignorant of the need of controls, utterly devoid of the critical faculty, lacking even a modicum of *common sense* Such an implication, I say, seems strange , it makes nonsense of university and medical training, just as—for the matter of that—Dr Julian's letter makes nonsense of *most* of medical precept and practice To become a G P does not necessarily mean to become a general paralytic In spite of the paralysing effect of festoons of panel and other red tape, of little intellectual society, and still less leisure, there are practitioners who try to keep up with new work, and try to add something to medical science as well as relieve the sufferings of mankind Like many other practitioners, I have women patients who have been relieved of a " wind in the bowels " only to find it has become a " wind in the head " or the toe, but I have never yet heard of an eczema being " driven inwardly " and causing nephritis or myocarditis Apparently we don't see these things in the country

I will however, with your permission relate a little story It is not intended to be convincing but it is at least true On Christmas Day three years ago I woke up

to find that my little daughter aged 5½ months had a temperature of 104° and well marked bronchopneumonia She was at once given an ampoule of omnadin and the more usual treatment for her condition Next morning her temperature was normal and remained so and we never had the least further trouble with her If Dr Julian's assertion that this was due to suggestion is correct I can only say that at that tender age she was more susceptible to suggestion than she has proved since (Incidentally if the action of these drugs is due to suggestion, how is it that they act equally well if given when the patient is asleep?) Dr Julian will however find proof of the evil done that day in the fact that nearly three years later she developed an acute appendix The abundant fluid found in the abdominal cavity at the operation was undoubtedly that which we so summarily drove out of her chest three years before This theory however does not explain why she should have been so amazingly well in the meantime

Yet Dr Julian will at least admit that to produce such results it must have been a powerful drug and here I am entirely at one with him that these things need to be used with great care and discrimination That is why guinea pigs and cats are used so that by giving overdoses we may find where harm is likely to show itself and so avoid damage in therapeutic work Incidentally the reason we do not give medicines as he suggests to normal men is because our object is not to make men ill but to make them well

I do not for one moment suggest that the newer therapeutic remedies have come to stay Far from it Most of them only point the way to better things But that there has been an enormous advance in therapeutics recently I think no unprejudiced person can deny All honour therefore to those firms who are providing remedies many of which they know will soon be superseded And may we as doctors do our best with what we have got, instead of croaking because we have not got what we believe may come in ten or fifteen years time — I am etc

Winsford June 17th W N LEAK.

Vaccines in Coryza

SIR —The results obtained by Dr Hoyle in the employment of autogenous vaccines for the treatment of acute coryza may deter many practitioners from using stock vaccines in the treatment of that condition Dr Hoyle's failure to record better results may be due to (1) the composition of the vaccine and (2) the severity of the cases with inadequate number of injections and wrong dosage

I have used a stock vaccine for a number of years to protect patients against recurrent coryzal attacks and although I cannot give any accurate statistics I believe that I am safe in stating that at least 70 per cent of patients inoculated can be protected The majority can be protected by three injections at weekly intervals but there are others who require further injections at fortnightly or monthly intervals In severe cases it is sometimes necessary to give as many as eighteen to twenty A patient who suffered from almost continual attacks—he informed me that he used twelve handkerchiefs daily —was completely cured by a course of twenty injections He has remained free for more than three years But the proof of the efficacy of vaccine treatment lies in the fact that a large number of patients demand it annually

Dr Hoyle does not make it clear at what stage of the coryzal attack he treated his patients If in the acute stage it is quite apparent that he blundered in administration It is impossible to protect a patient who is suffering from coryza with three injections Indeed it is not safe to attempt to protect a patient who has any signs of coryza with what Dr Hoyle has evidently done—prophylactic dosage When any signs of coryza exist it is necessary to start with a small dose—for example 1/10 c cm —and to repeat every fourth day by doubling the dose until 1 c cm is reached and then to give the full dose at weekly intervals Care however should be exercised in increasing the dose as this must be regulated by reaction which must if possible be avoided The full protective dose and the number required vary according to individual susceptibility which is the important guide to successful treatment. It appears to me that an omission in Dr Hoyle's vaccine is the *Micrococcus catarrhalis* this I believe to be the precursor of all coryzal attacks and the other constituents secondary —I am etc

Edinburgh June 10th FREDERICK POPTER

Mind and Body

SIR —It was with especial interest that I read Dr C M Billington's remarks on my paper Experiences with Proteose in the Treatment of Diseases of the Skin as it came to my notice immediately after a morning's teaching in the out patient department in the course of which I had remarked to my students that a psychological factor is present in many cases of chronic urticaria In one case the patient's husband was in hospital suffering from carcinoma and she was paying daily visits to the hospital which was some distance from her home When her husband returned home and there was some temporary improvement in his condition in patient's urticaria almost disappeared It will be seen therefore that Dr Billington and I are so far in agreement I did not discuss this matter in my paper as I wished to keep to the subject of experiences with proteose —I am etc

Bristol June 15th NORMAN BURGESS M D M R C P

Control of Tuberculosis

SIR —One cannot help but be impressed by the large amount of investigation that is being made into the *raison d'être* of tuberculosis and your report of the Tyneside inquiry under the heading Causal Factors in Tuberculosis in your issue of June 10th (p 1018) is just another example But surely there is sufficient evidence that poverty with its concomitant factors —overcrowding under nourishment etc —is certainly a *predisposing* factor in the incidence of tuberculosis On the other hand tuberculosis does occur among the rich so that it is only reasonable to suppose that there is one prime *causal* factor common to all and what can that be but infection from person to person if one excludes the few cases resulting from the ingestion of infected milk etc? That this has been recognized in part is evidenced by the notices one sees in diverse places and couched in various terms admonishing one against expectorating Whether or not this has been a factor in the decline in the death rate from tuberculosis is impossible to estimate but in any case it is a reasonable precaution But there is no tangible evidence that the infection factor has been fully appreciated Infection is essentially in the home and during childhood and it is difficult to believe that spitting in the home is common among the rich or poor How then is the infection spread? The obvious answer is the spray of droplet infection by coughing and this factor is common to all classes with open phthisis and fits in with the clinical evidence of the disease

Can this be prevented or at least greatly minimized Yes by avoiding coughing without covering the mouth during the act—not with the hand but with a handkerchief To appreciate the force and density of this

unhindered spray one has only to travel in a crowded public conveyance in winter, or sit in front of a person with a cough in a theatre Desiring to ascertain if this precaution was being taught, I asked about one hundred patients who had had sanatorium treatment if they had been told to cover the mouth while coughing one admitted that she had, but the others denied having received such instruction Unfortunately, in the out-patient departments of some of our hospitals, patients are *not only allowed to cough as they please, but are ordered* to cough as a ritual, without any provision being made to limit the accompanying spray Is it because the practice is considered harmless, or is it neglect or apathy on the part of our teachers and public health administrators?

An intensive campaign to teach and enforce the precaution I have mentioned must find favour with all people who have the health of themselves and the community at heart It need not be expensive, and if it had the backing of the public health authorities and all the members of the medical profession, but particularly tuberculosis officers and sanatorium physicians, the Press and the public would soon fall into line While not wishing to belittle the efforts of those who are seriously trying to find a means of diminishing the incidence and mortality of tuberculosis, it seems reasonable that the obvious should not be overlooked or neglected amidst our masses of statistics Is it worth making a small effort which might easily be the means of preventing much ill-health and many deaths, especially of young children?—I am, etc ,

London, W 1 June 12th W BRUCE FRY

Treatment of Tuberculosis

SIR —It seems impossible to lay the ghost of tuberculin Some two or three times every year it is resurrected , the same old claims are put forward by the same protagonists, but no fresh evidence is forthcoming One would have thought that after all these years we should have arrived at a common agreement whether tuberculin is or is not an effective remedy against tuberculosis It is surely something of a mystery that a remedy so widely tested should still continue to give great results in the hands of a minority of the profession, while the rest of the profession have come definitely to the conclusion that it is of no therapeutic value How often those who deal with pulmonary tuberculosis must have wished that they could get the satisfying results from tuberculin that Dr Camac Wilkinson has persistently claimed to obtain But somehow or other it is not to be

Twenty years ago like many others, I tried tuberculin on a large scale and found that the only cases that appeared to do well were precisely those which one would have expected to do well under any treatment , but that when one tried it with those cases for which one would have given much to have found an effective remedy, it was useless or—worse still—resulted in exacerbation of the disease This experience was confirmed subsequently when tuberculin was tried on a sufficiently extensive scale *with proper controls*—a result which the tuberculin enthusiasts seem to have persistently ignored Dr Camac Wilkinson indulges in a prophetic vision as to the attitude of Dr Burrell towards tuberculin in ten years' time I would go so far as to venture to believe that the great master, Robert Koch himself, were it possible for him to have lived to the present time, would have admitted that tuberculin had not fulfilled his hopes as a *therapeutic* remedy—whatever its value in *diagnosis*

The scientific position of vaccines in therapeutics appears to be still open to question, as distinct from their position in prophylaxis, where it is established Professor J C G Ledingham, who should surely speak with some authority, made this clear in an article in the *British Medical Journal* of May 8th and 15th, 1926, and so far as I am aware the position remains unchanged I am glad to find that Dr Halliday Sutherland and Dr Camac Wilkinson both oppose the use of such a term as "pre tuberculous" The employment of such a term is unscientific, and is better dropped Dr Halliday Sutherland still believes that the more favourable cases of tuberculosis (meaning apparently pulmonary tuberculosis) can be treated at home by tuberculin, and would reserve sanatoriums "for the infectious, febrile, and debilitated patients" This is certainly strongly counter to the opinions of most tuberculosis specialists, but Dr Sutherland is surely—to put it mildly—rather unkind when he asserts that "the truth is that some medical superintendents of sanatoriums want early and hopeful cases *to improve their statistics,*" rather than because they believe that they are especially the cases which may be expected to benefit most from sanatorium treatment

Moreover, I would venture to dissent from his opinion as regards Switzerland Of course, many cases, we know, do well in England , but to say that such good results are just as likely to be obtained by treatment in England as in a climate like that of Switzerland is, I should have thought, against the evidence I know in which country I would prefer to take my chance—and I speak from personal experience, having had an unquestionable infection *some thirty five years ago,* for which I went to Davos —and I have always held that tuberculosis is one of those diseases in which money does count, giving the patient who can *afford to get away from the English winter* a distinct advantage over his less fortunate brethren Only let it be realized that there is no earthly use in imagining that a patient who is in an advanced stage of disease is going to do any better in Switzerland than he would in England Just as in England the sanatorium is likely to do most for the patient who comes "early," so in Switzerland it is the early case which benefits , but Switzerland has the immense advantage of offering "dryness, calmness," more equable temperature (conditions which Dr Sutherland belittles), and sunny skies, in place of the damp, cold, dreary, and inconstant English winter

As regards other considerations, no fool, as I believe Marcus Paterson said, can be cured of phthisis, and the man who will not co operate in his own treatment will do no better in Switzerland than elsewhere The great little Dr Huggard in the Davos of thirty five years ago had a short way with such patients He simply told them or their relatives that the sooner they went the better —I am, etc ,

Uses and Dangers of Cosmetics

SIR,—On May 17th, 1930, a paper of mine on modern cosmetic preparations was published in the *British Medical Journal* (p 899) It achieved a horrid notoriety in the daily press, and was honoured by some slight attention of a depreciatory nature in one of the journals which voice the opinions of the vested interests the *British Journal of Dermatology* appeared to consider it to be of some little interest What criticism it aroused was either fair comment, backed by scientific argument, or else mere journalistic facetiousness which, I hope, helped some hungry free lance workers to earn a little bread and-butter

The paper by Dr Alice Carleton, which is published in your issue of June 10th, is somewhat provocative in nature, first, because the author fails entirely to

Marmite Therapy in Anæmias and in Vitamin B Deficiency

Anæmias

That Marmite therapy has gained a definite place in the treatment of certain types of anæmia is evident from the reports which continually appear describing the advantages of this form of treatment

Remarks such as the following testify to the efficacy of Marmite—

"Further trials have confirmed my previous findings as to the curative action of this preparation" (*Ind Med Gaz, March*, 1933, *p* 133)

Vitamin B

Marmite is recognised as a potent source of the Vitamin B complex This is clear from innumerable references to the subject in the medical press and from the Medical Research Council's Report on Vitamins, which recommends—

"Marmite for Vitamin B complex—a small quantity daily"

(*Vitamins A Survey of Present Knowledge*, 1932, *p* 276)

MARMITE

(Registered Trade Mark)

In Jars 1 oz 6d, 2 oz 10d, 4 oz 1/6, 8 oz 2/6, 16 oz 4/6

Special quotations for supplies in bulk to hospitals and institutions.

Sample and literature on application to—

UROTROPAL

Urinary Antiseptic

Prepared by Savory & Moore Ltd at the suggestion of a Leading West End Physician

A highly efficient Uric Acid Solvent in effervescent granular form Laxative and mildly diuretic Possesses internal antiseptic properties which are manifested particularly in septic bladder conditions

Indications Arthritis, Cystitis, Pyelitis, Rheumatism, Gout, and in diseases of the Prostate

Dosage From one to three teaspoonfuls

CONTAINS:

Strontium Lact.
Lithium Carb
Caffein et Quin Cit
Sodii Ferm Benz
Calc Lactophosph
Pot et Sod C t
Sod Sulph
Hexamethylenetetramine

Two sizes
4/6 8/6
per bottle

Harmless and Non-toxic

Tonic and Restorative

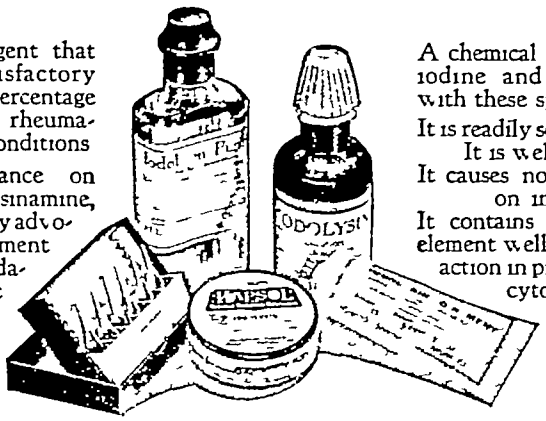
TRADE "IODOLYSIN" MARK

Strikingly successful in Rheumatoid Arthritis

A therapeutic agent that gives really satisfactory results in a large percentage of cases of chronic rheumatism and allied conditions

A distinct advance on uncombined thiosinamine, which was formerly advocated for the treatment of scar tissue exudations, and chronic rheumatic disorders



A chemical combination of iodine and thiosinamine with these special features

It is readily soluble in water
It is well tolerated
It causes no local reaction on injection
It contains in iodine, an element well known for its action in promoting leucocytosis and helping absorption of inflammatory products

"Iodolysin" is supplied in ampoules for hypodermic injection, in capsules for oral administration or as an ointment or paint for local application.

acknowledge the assistance my paper has been in the construction of her own contribution and secondly because by making full use of fragmentary excerpts torn from their contexts she attributes to me a bias which is I think undeserved Upon reading her remarks I learn that I have stated that cold creams and vanishing creams block the sebaceous and sweat glands and that their use leads eventually to acne rosacea and acne vulgaris What any person who troubles to consult the article in question will find is that in discussing the probable and possible ill effects of the frequent application of cold and vanishing creams (formulae for which are given) I have emphasized the fact that any remarks made under these headings refer to the prolonged use of the preparations The reservation is justifiable because once a woman has taken the trouble to learn a beauty treatment the routine is usually carried on daily for some years I certainly stated that the fats block the sebaceous and sweat glands and if I had written the fats and waxes tend to block the sebaceous and sweat glands it might have been more accurate With regard to the production of acne vulgaris the actual words used were the formation of comedones is thus facilitated and acne vulgaris may develop especially if the patient is between 17 and 25 years of age

I am not as Dr Carleton insinuates unaware that dirt may be removed with cold cream but I still believe the definition clean—free from foreign matter and a skin is not clean which is wiped down with cold cream massaged with vanishing cream and then powdered being left coated with a layer of grease to which dust as well as toilet powder readily adheres With regard to Sutton's experiments on the absorption of fats even though a very small proportion of the fats in a cream or skin food are absorbed is there any evidence to show that they are absorbed by the epidermal cells and act as foods ? We are told that McCafferty and Genovese made experiments with patients with moderately dry skins and observed the effect of washing their faces with soap and water We are not told the extremely important facts as to why these patients had moderately dry skins Was the moderate dryness due to chronic seborrhoeic dermatitis hypothyroidism xeroderma or to the gradual atrophy of their sebaceous glands due to years of cosmetic treatments? If so the use of soap and water was not entirely to blame for any desquamation that occurred and the conclusion which is reached is not valid Finally I object to being classified by insinuation as a person who condemns cosmetics as wholly injurious Cold cream is a useful emollient and vanishing cream a less useful preparation for the same purpose The windmill against which I have tilted is the continuous use of cosmetic preparations—the endless application of astringent lotions and fatty and waxy ointments to the detriment of the individual and the very definite benefit of numerous commercial interests — I am etc

Liverpool June 12th R M B MACKENNA

Treatment of Breast Abscess

SIR —After reading the most interesting article in the *British Medical Journal* of June 10th by Mr Hamilton Bailey on The Treatment of Abscess of the Breast I feel that it might be of some interest to readers to know of the years success we have had at the Christiana Hartley Maternity Hospital Southport since we have developed a form of treatment for aborting breast abscess This however entails the close co-operation of a conscientious staff

In the hospital as a routine every patient has a daily dose of a mixture containing 10 grains of quinine sulphate This I mention as it may have some bearing on results With a view to aborting breast abscess as we tried Bier hyperaemic bell but like the experience of Mr Hamilton Bailey we found it caused intense pain and an unsatisfactory result and gave it up We gradually evolved the following regime which so far has been encouraging as we have had no breast abscess for over a year with over four hundred cases

Every morning after the babies have fed the sister makes a careful examination of every breast to see (1) if they have been thoroughly emptied by the baby (2) if there is any tenderness whatsoever on carefully palpating the breast The examination is repeated after the evening feed by the sister or staff nurse on duty The staff nurse on night duty makes a similar examination before she leaves the wards in the morning

If the breast has not been thoroughly emptied this is completed by Dr Abt's electric breast pump The ordinary hand breast pump which was used previously caused the patient nearly as much pain as the Bier's hyperaemic bell but Abt's pump causes no more pain than the sucking child and is most effective Now if (1) the ducts are not all emptied or (2) if there is tenderness over any part of the breast massage along the ducts towards the nipple is commenced at once and every acinus is followed up to see if milk comes from the duct (3) Where there is tenderness on palpation a slight swelling can usually be felt massage with olive oil over this swelling is at first painful and result in some clotted milk being forced out or even milk intermixed with pus The baby is put on the breast as usual and the breast massaged after each time the baby feeds

The sister tells me that occasionally a patient develops a rigor although pulse and temperature at the last taking were normal If there be no other cause a blocked duct can always be found and relieved But the secret of our possible success is undoubtedly the conscientious and careful examination of the breasts three times a day and the instituting of massage *at once* The daily breast drill is essential and treatment by massage to be successful must be commenced at once before any of the classical signs of abscess have developed —I am etc

Southport, June 13th A S GARDEN M D L M

Treatment of Compound Fracture of the Femur

SIR —How easy life would be if septic wounds could be excised and closed with impunity! It is though perhaps scarcely fair to take reported statements made in a witness box as a true expression of medical or surgical opinion The desire of counsel to obtain a direct affirmative or negative answer to questions which are open to argument is incompatible with accurate or helpful statements being made

An open (compound) fracture of the femur which has become heavily infected is probably at the best two or three years concern at the worst it may be loss of the limb or of life It does not seem possible therefore for anyone who takes over such a case for two or three weeks to have either immediate or ultimate full responsibility for an indifferent result When faced with an already infected fracture treatment must be directed towards controlling sepsis the alignment of the fractured fragments having become for the time being a secondary consideration In my opinion manipulation for reduction of a displacement should not be attempted at this stage but the limb should be immobilized by means of splinting and traction as the best means of dealing with the sepsis and of bringing about some gradual improvement in the alignment I gather this was the treatment adopted in the particular case under consideration (May 27th p 942)

The only time that active and accurate treatment can be carried out in an open fracture with success is in the first few hours after the accident, and then only in an institution which has the capacity to deal with such cases Until this is still more fully realized and arrangements are made in every district for the more efficient handling of fracture cases it is to be feared that these lawsuits will be a recurring indignity —I am, etc ,

London, W June 14th F D SINER

SIR —In your issue of June 10th appeared a letter from Mr C H Fagge commenting on an action against a surgeon for negligence in the treatment of a compound fracture Mr Fagge's view that the present method of conducting these cases is against the public interest and is derogatory to the reputation of the profession must be shared by many who have given serious thought to the matter It is scarcely possible for a lay judge and jury, without the guidance of a neutral medical assessor, to sift and evaluate the evidence given by rival expert witnesses in cases of this nature, and it would be to the interest of all concerned that the whole subject should be aired in the hope that opinion might be crystallized and that improvement in the procedure might follow Members of the legal profession would surely be glad to assist, for they must often picture the situation that would arise if barristers were sued for negligence after the termination of a difficult case, and if such actions had to be tried and conducted before a judge and jury who had no special legal training or knowledge

I am not in a position to form an opinion on the rights or wrongs of the verdict in the case just decided, and it seems to me that Mr Brockman had no choice but to give evidence and express his considered opinion of the treatment of the patient before and after the latter came under his care While the present method of trying these actions is in force however one cannot but feel critical of the attitude of members of the profession who, having had no responsibility for the treatment of the patient, are willing to come forward and give evidence in support of an action for negligence in cases such as this — I am etc ,

London W June 14th GEOFFREY MARSHALL

Monilia Infection of Respiratory Tract

SIR —I have read with great interest in the *Journal* of May 27th p 917) Dr P J Marett s note on monilia infection of the respiratory tract, and have noted his figures as to the incidence of monilia in sputa in Jersey I believe in connexion with this point that most people who have had occasion to handle large numbers of sputa will agree as to the high incidence of monilia therein, but that unfortunately does not necessarily prove pathogenicity as is elsewhere recorded, one can find monilia with great frequency in the upper respiratory tract of many apparently normal people That such monilia might gain access to bronchi in cases of subnormal health of the mucosa seems beyond question, but to postulate an active primary broncho moniliasis seems a very tall order, and, indeed, from Dr Marett s own note, there is evidence refuting this He says ' If we compare the bronchi and bronchioles to test tubes ' Now in my submission we can only liken the bronchi and bronchioles to test tubes when they are grossly diseased and full of retained secretions when so diseased as to have lost the power of expelling their contents , and so once again, we see that as far as pulmonary disease is concerned monilia must be regarded in the nature of a secondary invading organism —I am, etc ,

DAVID H HALER

Infants Hosp 31 Vincent Square June 2nd

Pancreatitis in Mumps

SIR,—Dr A H Spicer may be interested to know that some nine months ago I saw a boy aged 7 years who was admitted to hospital in a moribund condition ten days after the onset of an apparently ordinary attack of mumps The main symptoms were restlessness, repeated blood-stained vomit, and a rapid, feeble pulse The abdomen was not distended, while, possibly because of the boy's condition, no complaint of pain or tenderness could be elicited The patient died soon after admission and a post-mortem examination showed the macroscopic and microscopical appearances of acute pancreatitis No other gross lesion was found in the body One swallow does not make a summer, however, and so far as I know no other similar case has been reported in this country —I am, etc

E JAMES,
Medical Superintendent

Treatment of Sydenham's Chorea

SIR —I was interested in Dr Donald Bateman's article (*Journal* June 10th, p 1003) on the treatment of chorea by artificial pyrexia, since I myself began to use this method in November, 1931 shortly after I received details from an eye-witness of Lucy Porter Sutton's cases in New York City It is a pity that Dr Bateman merely reiterates Dr Sutton s claims, and does not give any details of actual cases, or his opinion of the value of the method, beyond the statement that " the treatment has so far proved satisfactory " Such a general recommendation may be insufficient to induce others to try this method

It has been repeatedly emphasized that the degree of cardiac involvement in any rheumatic manifestation such as chorea is of prime importance Since a large proportion of choreas have some form of carditis, the inevitable question will be asked, Does the artificial pyrexia have any adverse effect on the heart condition? Neither Dr Sutton nor Dr Bateman appears to have considered this point, but have merely concerned themselves with the movements which are but the outward manifestation of the disease There is thus a danger in any form of treatment which rapidly checks the movements, since it may give rise too early to the conclusion that the case is cured

I hope shortly to publish a series of cases in which this new method of treatment has been tried and in which sufficient time has elapsed subsequently to give an indication as to whether or not induced pyrexia has a beneficial or harmful effect—both immediate and remote—on the course of Sydenham's chorea —I am, etc

The G P and Midwifery

SIR —I read the article by Professor Munro Kerr on the above subject, and the subsequent letters from Drs Mackenzie (June 3rd, p 983), Popplewell, Abercrombie and Fraser (June 17th, p 1078) with interest Dr Popplewell states that, after a thorough grounding in modern hospital maternity work, he was appalled to find an area in England eighty miles from London, with a population of at least 60,000, without a maternity hospital of any kind, let alone an ante-natal clinic, and that the only general hospital in the area clearly states that it has no facilities for treating maternity cases I am in complete agreement that the lack of hospital facilities

ALOCOL

Colloidal Hydroxide of Aluminium

THE increasing prevalence of gastric ulcer and hyperchlorhydria has produced an advance in the treatment of these diseases

"Alocol" (Colloidal Hydroxide of Aluminium) provides an antacid medicament far superior to subnitrate of bismuth, bicarbonate of soda and other alkalis These merely afford a certain degree of ease, without bringing about a permanent relief of the condition

"Alocol" absorbs the excess of hydrochloric acid without interfering with the normal antiputrefactive function of the gastric juice or harmfully affecting the processes of nutrition

"Alocol" has been subject to extensive clinical trial, and literature giving full particulars of the results will be gladly sent to medical men on request

For Acute or Chronic Cases of Hyperacidity

For Gastric Duodenal or Pyloric Ulcers

Works KING'S LANGLEY, HERTFORDSHIRE

M 232

A Distinct Advance Over Preparations of Acetyl-Salicylic Acid

Acetyl-salicylic acid possesses a notable disadvantage Physicians have proved that it cannot be tolerated by patients suffering with a delicate stomach Consequently, the value of this medicament in the wide field in which it is indicated is very seriously reduced

'Alasil completely overcomes this objection By combining calcium acetyl salicylate with Alocol unfavourable secondary action upon the stomach is prevented This beneficial influence is undoubtedly due to the presence of Alocol (Colloidol Hydroxide of Aluminium) which preparation has brilliantly stood the test of practice in the treatment of hyperacidity and other ill conditions of the gastric tract Alasil is therefore a triumph over acetyl salicylic acid It enables higher doses to be administered and maintains the patient's system under its influence for a greater length of time Analgesic, Antipyretic and Sedative 'Alasil is indicated in all cases where acetyl salicylic acid has been used heretofore

A supply for clinical trial with full descriptive literature sent free on request

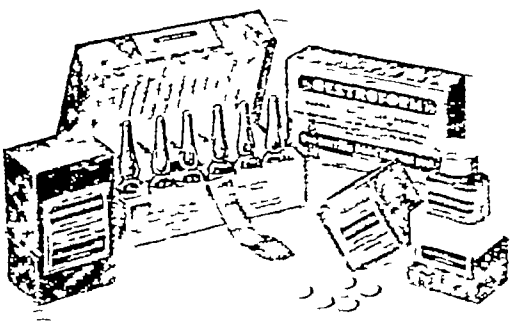
OESTROFORM



Oestroform is a standardised preparation of the crystalline ovarian follicular or oestrogenic, hormone of exceptional activity It is available in the form of a sterile solution for injection also in the form of a tablet for oral administration.

Oestroform is a highly active product, and it is now offered at a price which permits of its being employed as a routine measure in the ordinary course of general practice. Particulars of modes of issue are as follows —

In a sterile solution for injection

Standardised biologically to contain 1000 units (B D H) per c.c.

Boxes of 6 × ½ c.c. ampoules per box 3s. 6d Boxes of 6 × 1 c.c. ampoules per box 6s 6d.

In tablets for oral administration

Standardised biologically to contain 1000 units (B D H) per tablet

Bottles of 20 tablets per bottle 9s 6d Bottles of 50 tablets per bottle 17s 6d.

Sample and literature on request

In the treatment of chronic arthritis and other chronic stages of disease

In the treatment of chronic arthritis Contramine is now employed as an ordinary routine measure. Its value is evidenced by the following report —

'I use Contramine extensively in my practice I find that it scarcely ever fails to relieve pain in chronic rheumatic and arthritic conditions — — — M.R.C.S., L.R.C.P

Furthermore in other chronic stages of disease Contramine is employed with signal success as for example, in the treatment of chronic complications of gonorrhoea and fibrositis also in chronic neuritis and chronic intestinal intoxication

In Contramine, therefore, the physician in practice finds a valuable addition to his armamentarium for administration in chronic arthritis and in other chronic complications of various origins

in the area is appalling to say the least But would an ante natal clinic enable Dr Popplewell to relegate his perforator and cranioclast to the museum of obsolete instruments? I think he would find that if a clinic were established in his area the number of working-class maternity cases he would have the opportunity to offer ante natal supervision would fade almost to zero and he would only be called in when some abnormality became apparent either before during or after labour

Professor Munro Kerr's wish for better methods in the training of the student in practical obstetrics and ante natal care is very praiseworthy but will the fruits of his labours not be lost if the clinics which he advocates take away the means by which the practitioner whom he has trained so thoroughly keeps his hand in? How long would the general practitioner remain proficient in the use of the stethoscope if he were allowed to use it only on half a dozen or so of his better-class patients during the course of the year? The powers that be should make up their minds whether they require the services of the G P or not in their maternity schemes If they decide that they are themselves to be responsible for the ante natal care of the pregnant woman they must in fairness to the patient be responsible for the treatment of abnormalities arising during parturition If on the other hand they decide that they still wish for the services of the G P in cases of difficulty they must in fairness to the patient and the practitioner give the practitioner the care of his patient during the ante natal period

In regard to the question whether the home or hospital is the better place for the woman of the working class to have her baby I think one has to take into consideration the type of woman The majority of working-class women are house proud and keep their homes spotlessly clean however poor the house may be That type is infinitely happier in her own home as Dr Mackenzie says The other type happily in the minority and chiefly confined to the cities is too lazy to bother about where she is confined and makes little or no provision for the event it is therefore better for all concerned that she should be submitted to the officialdom and routine of hospital which Dr Mackenzie describes

I believe that if the standard of midwifery in this country is to be raised a national scheme on the lines suggested by the Glasgow Division of the British Medical Association (*Supplement* June 10th) will have to be evolved In existing circumstances the authorities will have themselves to blame if the general practitioner's midwifery does not keep abreast of the times and if the highly proficient product of the proposed new teaching method rusticates.—I am etc

Epsom June 17th TERENCE G ROBINSON

SIR,—Dr E B Mackenzie's letter in your issue of June 3rd delights me Immediately after qualification I went for a fortnight as locum for the parish doctor of two Orkney islands Well do I remember my first maternity case—a moonlight night and having to drive myself in a little cart across the sands at low tide to get to a two-roomed shepherd's cottage The shepherd walked about outside all night and an old and dirty woman—the hands woman—made up the peat fire till my eyes streamed with tears and explained to me where the clothes and the whisky bottle were kept and departed The patient lay on straw I have never forgotten that night alone in the intervals of fetching what was wanted and washing my hands I thought of every complication likely to occur—occipito-posterior prolapse of cord post partum haemorrhage uterine inertia and what would one do alone on this island in the middle of the sea if Caesarean section became necessary In self-defence I was silent except to assure the patient that all was well and I remembered Dame Mary Scharlieb's remark that in midwifery fools usually rushed in where angels feared to tread To my surprise the crofter-midwife tiptoed herself quite normally about four in the morning as the cold dawn was creeping in and was much less perturbed about the whole process than I was or following with knowledge as I seemed to be!

That taught me a lesson—and though I have seen about as bad obstetric cases in India as anyone I have never forgotten it—that birth is a natural act and will accomplish itself simply if you or your stupid civilization have not put obstacles in the way by deforming the pelvis when growing suffering the joints of the brim that it cannot expand and most important of all in that the woman is confined in an unnatural position This last is the only one of the obstacles we have it in our power to control when she is already in labour De Jellett of Rotunda fame in his book *Maternal Mortality* (p 260) explains why the squatting position is the natural one for accouchement and my wife here by kind permission of Professor Rechou in the Department of Radiology demonstrates the increase in size of the human pelvis in the squatting position and the area enclosed by the chest walls is increased by inspiration This being so the crouching position must exert a suction action on all the abdominal contents and is of course the only position in which bladder bowel or uterus can be completely emptied

If people would only read *Histoire des accouchements* by Witkowski they would see that many harmful acts been hedged about by superstitious practices perhaps in order to make it more difficult and more impressive for the patient He gives over 1 000 illustrations and along side of holy girdles holy chairs to aid delivery holy images to ensure safety to mother and child we are shown the woodcut copied from Playfair of position des Anglaises pour accoucher and we are told that though the English idea of confinement is not in Ireland and Scotland the women are often confined squatting and that if the confinement is normal they go down on knees and elbows because they believe this position will hasten the labour and diminish the pain As I cannot get anyone in England to allow me to do anything so dangerous as to return to Nature and allow the patient to do herself naturally I have had to come to France to study the subject because many French women still insist on being confined thus—when the *docteur* is not there—I am etc

Bordeaux June 8th KATHLEEN VICH

I M S Pensions

SIR,—Colonel W G King has replied and truly protests on the statement that the pension of officers of the Indian Medical Service are not guaranteed by the British Government deserves more than a passing reply Pension is deferred pay and has always been a great inducement whereby to obtain recruits for the Service The present situation is far more full of peril for young officers who have recently entered the Indian Medical Service or for men who are thinking of doing so than for the men who retired From all the signs to-day the danger will grow with the years

To look to the Indian administration for protection is to lean on a reed The real source of strength lies in the British Medical Association which fought so fiercely for the I M S in 1914–20 It is well known that the Indian Government is anxious to keep up the standard of its recruits and to attract a certain number of good European officers Can the B M A fairly advise young officers to join the I M S under the conditions of uncertainty now prevailing? It has greater power to-day

FOR INTERNAL TREATMENT OF GONORRHOEA, URETHRITIS, AND OTHER AFFECTIONS OF THE GENITO-URINARY TRACT

SANTAL MIDY CAPSULES have been prescribed with uniform success for over thirty years Distilled from carefully selected Mysore Sandal Wood the oil is bland and remarkably

FREE FROM THE IRRITANT AND NAUSEATING EFFECTS

which are provoked by many preparations
There is marked absence of gastric and other disturbances diarrhoea and skin eruptions Its mild chemotactic properties permits its administration in relatively large doses without fear of too violent reaction or tolerance.

SANTAL MIDY CAPSULES may be prescribed and relied upon in all stages of Gonorrhoea and in other forms of Urethritis and affections of the Genito-Urinary tract
The Capsules contain 5 drops and usually 10 to 12 are given daily in divided doses

Prepared in the Laboratoire de Pharmacologie Générale 8 Rue Virienne Paris and sold by most Chemists and Wholesale Druggists throughout the World

Obituary

ROBERT HAMILTON RUSSELL, F R C S

Consulting Surgeon Alfred Hospital and Children s Hospital Melbourne

The death of Mr R H Russell at the age of 73, following a motor accident in Melbourne on April 28th, has removed one who achieved world-wide eminence as a pioneer of surgery in Australia, a country to which he brought the teaching and enthusiasm he had derived from direct contact with Lord Lister

Born at Farningham, Kent, in 1860, Robert Hamilton Russell received his medical education at King s College, London, where he was one of Lister's pupils, and subsequently became the last house surgeon to work under his personal guidance He obtained the diploma M R C S in 1882, the L S A in 1884, the L R C P Lond in 1886, and the F R C S Eng in 1889 Fellowship of the American College of Surgeons was conferred upon him in 1924, and in 1927 he became one of the first Fellows of the College of Surgeons of Australia His first appointments after qualification included those of house physician at King s College Hospital, under Dr William Playfair, and for two years house-surgeon at the Shropshire County Hospital Following the custom of the time he also studied in hospitals on the Continent Mr Russell went out to Melbourne in 1889 and, apart from journeys to Europe and America, and service in France and England during the war remained in continuous practice there until his retirement some seven years ago He was appointed surgeon to the Alfred Hospital and Children's Hospital, retaining both posts until shortly before his retirement Lister had inspired him with a zest for research, and the results of Russell s original work soon brought him into prominence He identified himself at first with the treatment of hernia, and a paper by him on the aetiology and treatment of this condition in the young was read before the Intercolonial Medical Congress at Brisbane in 1899 and subsequently published He followed this up with papers on cognate subjects, and his views attracted considerable attention—to begin with often of a controversial nature He was also responsible for original and important work on the treatment of fractures Following his master he became renowned as a teacher of students, and some years ago his house surgeons gathered together to express to him personally their gratitude for the benefits he had conferred upon them A man of singularly attractive personality and exceptional scientific ability, he exerted a powerful influence on the profession especially towards the improvement of surgical technique

In recognition of his work on behalf of the Alfred Hospital the new community block there has been named after him His bust stands at the entrance to the hospital, and a life mask has been placed in the Institute of Anatomy at Canberra He was in England at the outbreak of war and went to France with the British Expeditionary Force He returned to Australia before November, 1918, and was attached for a time to military hospitals there With his great intellectual and personal endowments it was natural that he should take an active share in the creation of the Royal Australasian College of Surgeons in 1927 He was a member of its council from its inception At the time of his death he was censor-in-chief of the college, being in control of admissions to its Fellowship As a tribute to his work on behalf of surgery the Fellows of the college presented to him two years ago his portrait painted by George Lambert He had attended his last meeting of the council two days before the fatal accident Mr Russell was a highly esteemed member of the British Medical Association

C G C SCUDAMORE L R C P AND S ED

Croydon

We regret to announce the death on June 11th of Dr Charles George Colin Scudamore, who was for many years the mainstay of the Croydon Division of the British Medical Association After studying in Glasgow and Edinburgh he obtained the Scottish triple qualification in 1893, and three years later started practice at Croydon

Dr MORTON MACKENZIE writes I have been asked to write something of the work done by Dr Scudamore for his colleagues beyond the Division of which he was secretary for so many years and in deeply mourning the loss of my old friend I wish to pay a tribute of gratitude to one of those hard-working, loyal members whose steady work, without perhaps coming to the notice of those outside his own area as it deserved, has done so much to augment the strength of the Association during many years He was the representative of the Croydon Division for thirteen years, and for the same number of years served on the Surrey Branch Council , he was president of the Surrey Branch in 1924 and till his illness he never missed a meeting He also served on the Organization Committee and Propaganda Subcommittee, and to his great pleasure was elected to the Council of the Association in 1929–30 Regular in his attendance sound in his judgement, he was a most useful and loyal colleague to those with whom he served, and it is to be hoped that his splendid example may encourage some of our younger members to carry on the tradition he built up in Croydon and in Surrey

Dr P W HAMOND writes Dr Scudamore commenced practice in Croydon about thirty seven years ago and during the whole of that time he took an interest in the work of the Association For several years he was joint secretary of the Division with Dr Willock and on the departure of the latter from Croydon in 1920 Dr Scudamore became senior honorary secretary, and shortly afterwards I was appointed his assistant secretary As all who have been connected in any capacity with the work of the Division know, Scudamore was the man to whom we turned whenever any problem arose or any difficult bit of work had to be done He had the procedure of the Association at his finger ends, and, combined with his exceptional administrative and organizing ability he had an understanding of human nature and a tact which rendered it a pleasure and a privilege to work with him His heart was bound up with the welfare of the Association, and especially of the Croydon Division, and nothing he could do to forward the interests of either was ever left undone When in 1931 he was elected chairman of the Division a post he would have held long before had it not seemed impossible to do without him as secretary he agreed to occupy both positions, and did so with equal efficiency and success

Dr NORMAN E ALDRIDGE formerly of Southampton died at Alton on June 15th aged 71 Son of J H Aldridge M D J P of Southampton whose forebears for many generations lived in Hampshire he received his medical education at Edinburgh University where he graduated M B C M in 1884 He obtained the D P H of the London Royal Colleges in 1890 After taking up general practice in Southampton he became interested in radiography and in 1896—very soon after the discovery of *x* rays—became one of the earliest workers in this field Some few years later when the importance of this subject was apparent he devoted himself entirely to electrotherapeutics Having served as house-surgeon to the Royal South Hants and Southampton Hospital he was appointed honorary physician in 1893 and was in charge of the radiotherapeutic department from its incept on until 1929 when he retired as senior physician having been on the honorary staff of the hospital for thirty six years His work for the hospital has been fittingly commemorated by the naming after him of one of the new wards Dr Aldridge was also for some years radiographer to the Hants County Hospital Winchester and to the Southampton Infirmary During the war he served with the rank of major R A M C (T) as radiologist to the Royal Victoria Hospital at Netley and the Auxiliary Military Hospital at Southampton and latterly was inspector of radiography Southern Command It was during this period under the high pressure of work that he contracted *x* ray dermatitis of both hands which gradually extended until in spite of more than one operation he became completely crippled and on this account had to give up practice

Medico-Legal

DOCTOR INJURED IN MOTOR CAR ACCIDENT

£12 000 DAMAGES AWARDED

At Gloucester Assizes on June 9th before Mr Justice Lawrence and a special jury Dr Abraham Goldfoot a medical practitioner of Cheltenham brought an action against Mr R J K Brewer a publishers salesman of Bristol for damages for personal injuries received in a motor car accident

Sir Patrick Hastings K C for the plaintiff asked the jury to award Dr Goldfoot not merely substantial but very heavy damages In June of last year Dr Goldfoot was driving from Cheltenham to Clifton Something went wrong with his car and stopping at the side of the road which was twenty five feet wide he got out and opened the bonnet and looked at the carburettor Defendant's car was coming in the opposite direction Defendant pulled his car out from behind a larger one and in attempting to pass it struck the plaintiff and despite the fact that the doctor was seriously injured the defendant drove on He did not return to the scene of the accident until three-quarters of an hour later when he refused to give any explanation to the police Later he alleged that the plaintiff had walked suddenly out from behind his car but there was no foundation for that statement The injuries which Dr Goldfoot received were extremely serious His right hand was rendered useless and since the accident occurred his practice which had risen in seven years from £700 a year to £1 500 had to be conducted by a locumtenent to whom he gave what assistance he could He could not even write a prescription and up to now there was no sign of real improvement of his hand Professor Hey Groves said that he could give no definite promise that Dr Goldfoot's hand would ever be right again

Sir Reginald Coventry K C for the defendant said that his case was that Dr Goldfoot was mistaken as to what had happened The injuries he had suffered could not have been received in the way he claimed He suggested that Dr Goldfoot stepped out from behind the car which made the case one of contributory negligence The defendant in evidence said that he had been driving a car for two and a half years without accident He saw a stationary car with a man standing in front of the radiator While he was trying to pass a large car in front of him someone stepped from behind the stationary car but he had not the slightest idea that he had touched him and drove on He admitted that as a result of the accident he had been convicted of dangerous driving and of failing to stop after an accident Dr Hill Ernest Griffiths a consulting surgeon said that in his view the improvement in Dr Goldfoot's hand was likely to continue during the next two years the grip he could now exert when the hand would be a really useful member and he did not think Dr Goldfoot would ever be able to act as midwifery or surgery again At the same time he would be a considerable amount of useful work which he could do in his practice even if his hand remained as at present

The jury awarded Dr Goldfoot £12 000 damages and the judge granted a stay of execution for fourteen days subject to payment into court or the giving of a bond for the amount awarded

Universities and Colleges

UNIVERSITY OF CAMBRIDGE

At a special congregation of the Senate on June 8th the honorary degree of Doctor of Science (Sc D) was conferred on Sir Frederick Gowland Hopkins M B F R C P P R S Professor of Biochemistry in the University

Among those who received the degree of Ph D on June 9th was Mr L W G Malcolm M Sc conservator of the Wellcome Historical Medical Museum London

Under Regulation 15 for degrees in medicine and surgery the Faculty Board of Medicine has published in the *University Reporter* for June 13th a revised schedule for Part IV of the first examination for the degree of Bachelor of Medicine The schedule which has been drawn up by the Faculty Board of Biology A and Medicine is to replace on January 1st 1935 the schedule published in *Ordinances* p 31

At a congregation held on June 17th the following medical degrees were conferred

A New Discovery of great value

IMPORTANT NOTICE

A combined disinfectant and permanent germicide

"VIRE-EX"

This preparation based on a Rideal Walker test, has a strength and efficiency several times in excess of the ordinary standard disinfectants

Being non volatile it maintains its germicidal effectiveness for an indefinite period.

The fluid can be used for impregnating all fabrics thus rendering them sterile and germ-destroying

BRITISH ASSOCIATION OF HYGIENE LTD

Will be pleased to supply full particulars to members of the Medical Profession or to receive calls from them at their offices.

Tel METROPOLITAN 6374

Prescribe Aspirin Externally

"RADIAN β" exhibits aspirin in a form permitting of local absorption for relieving pain Combined with aromatic essential oils the whole is solutionized in alcohol

"Radian β" is a non-greasy liniment with an alcoholic base and not unpleasant to use. It is readily absorbed and reaches the comparatively deep-seated tissues

"Radian β" contains (1) A laevo-rotatory menthone derivative, (2) Aspirin, (3) A synthetic camphor

"Radian β" has the property of **activating exudates,** and is particularly useful in rheumatism, synovitis, sprains, etc By stimulating the lymphatics, it induces the exudates to be passed on to the venous system

Radian β

"Radian β" has been found a **valuable adjunct in physiotherapy,** e.g, in conjunction with radiant heat treatment, etc, in neuritis, and painful local conditions such as rheumatic affections

"RADIAN β" BATHS are a convenient and useful means of easing rheumatism whether it is local or general

Other indications:—Swollen feet, ankles and legs can be relieved with "Radian β", post-operative troubles, after trauma and fractures, all cases where bone and fibrous tissues are involved with local infiltrations, static areas, with inability due to pain, and tendency to exostoses

Medical Notes in Parliament

[FROM OUR PARLIAMENTARY CORRESPONDENT]

The House of Commons this week took the report and third reading stages of the Finance Bill, and also of the Unemployment Insurance (Expiring Enactments) Bill The Estimates of the Department of Health, Scotland, and Public Education, Scotland, were down for discussion

In the House of Lords on June 20th the Aberdeen Royal Infirmary and Mental Hospital Bill and the Victoria Infirmary and Glasgow Act (1888) Amendment Bill were read a third time

The Road Traffic Emergency Treatment Bill was set down in the Lords for June 22nd

In the House of Commons on June 20th the Cancer Hospital (Free) Bill was read a second time

Finance Bill

During the report stage of the Finance Bill on June 19th Mr H WILLIAMS moved a new clause providing that British liqueurs and perfumed spirits might be warehoused in accordance with Section 95 of the Spirits Act 1880 for home consumption and accordingly that the words 'medicinal spirits or tinctures other than perfumed spirits' should be substituted for the words British liqueurs or tinctures or medicinal spirits' in Subsections (1) and (2) of Section 95 and in Section 74 of the Act Mr HORE BELISHA accepted the clause which was added to the Bill

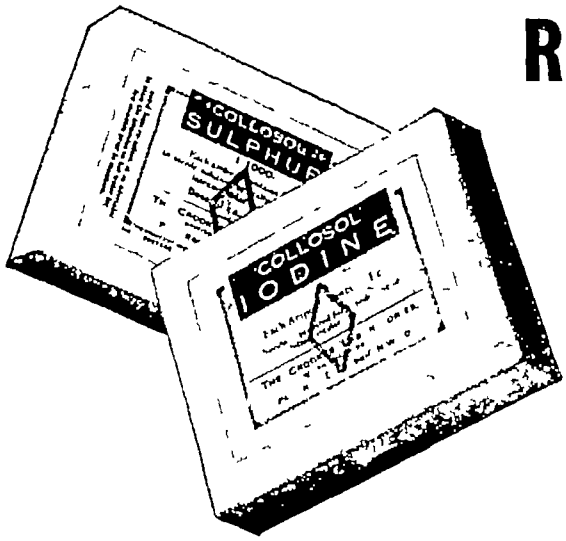
The Government also accepted a new clause to authorize the sale of spirits in half bottles by holders of retailers off licences in England and Wales During the discussion it was argued that this concession would meet the need for small bottles of brandy for medicinal purposes

Captain FRASER moved an amendment providing that heavy oil used as a fuel in any voluntary hospital for the sick poor equipped prior to April 25th 1933 with apparatus especially designed for the use of such oil should be exempt from duty He said that the amendment only asked that the rebate should be given in the case of voluntary hospitals, because it was only in their case that there was a very real difficulty in raising the money to pay the tax If the tax went on, a certain number of voluntary hospitals would have to reduce the services which they rendered to their patients In London there was a small number of hospitals using oil, and if they were to be compelled to pay the tax it would cost them about £12 000 a year In the provinces the figure would be about £8 000 so that the total cost of this concession would be about £20 000 a year That was very little indeed to the Chancellor of the Exchequer but it meant much to these hospitals Only about fifty five hospitals had installed and were using the plant and he asked the right hon gentleman to exempt them from the tax Where hospitals had this apparatus they had found it beneficial to their patients, because there was less noise and because it had made available for hospital purposes other parts of the building hitherto used for storage There was reason to believe that the concession could be worked and that it was administratively possible to operate it For example the Lifeboat Institution secured a rebate for lifeboats in the matter of the petrol duty Again alcohol when used for medicinal purposes was tax free There were plenty of precedents for this concession

Dr O DONOVAN in seconding the amendment said he did not wish to say anything on the question of cost Hospital managers would appeal to the public for more money for every new development in medical science and surgical art but he would like the Chancellor of the Exchequer to exercise a little more directive force in the development of hospital life We could heat our hospitals with coal but those of them who worked in hospitals felt that better work could be done for them by the administrative side if the latter was not compelled to give so much time to the very many administrative problems brought into being by the use of coal in the matter of storage insurance and man power If by encouraging hospitals to use oil fuel such administrative aid could be given to doctors and to the sick it would be an advance in hospital practice Major HILLS agreed that the was not entirely a matter of cost The real argument against the tax was that oil was a much better fuel for use in a hospital It was more convenient to transport and was easier to store which as hospitals were chiefly in busy centres was an important item The service of the oil was easier than in the case of coal, no stoking was required no ashes had to be removed and there was no dirt or noise with all their evil effects on patients It would be a set back to the modern equipment of hospitals if this tax was imposed It was recognized by the medical profession that by far the best fuel to use was oil fuel and he did not think that the Chancellor of the Exchequer would like to force hospitals back to coal Sir W DAVISON also appealed to the Chancellor to exempt the voluntary hospitals He said that any hospital which might, in future be inclined to install plant for burning oil would do it with its eyes open and would have to make provision for the additional expenditure By the tax the Cancer Hospital in his constituency would incur an additional charge of £900 a year and St George's Hospital would have to meet an additional cost of £2 000 Sir Arthur Stanley had stated in the *Times* that morning that it would cost St Thomas's Hospital £2 400 a year, or add 50 per cent to their bill for fuel Major LLEWELLIN said that the Cancer Hospital in his constituency would have to pay an extra £500 a year if the duty were levied on oil That would mean that the hospital could take in fewer cancer cases They had not the capital available with which to alter the machinery already installed in the hospital

Mr CHAMBERLAIN said that everyone who had represented the Treasury knew how difficult it was to resist these insidious and rather dangerous arguments which were brought forward in support of a concession which was asked for on the ground that it was only a little one The precedents which had been quoted showed how dangerous it was to begin whittling away the foundations on which one rested and how one concession was immediately made the precedent for asking for another He had already thought of asylums, sanatoriums and convalescent homes and if he had more time he could think of many other institutions supported by voluntary contributions which might make an equally sound claim When in addition to the argument that this was only a little concession, they were brought into contact with the idea of voluntary hospitals and the relief of the sick poor, the sympathies of everybody were naturally aroused, and it was perhaps easy for all of them to be led away towards the cause to which their inclinations would naturally turn them If it were actually true that all these hospitals which were dependent on voluntary contributions would be obliged to find an additional £400 £500 £1 000 or £2,000 a year it would be very difficult to maintain his position but he had a very good reply After all although the supporters of the amendment had adduced the convenience of oil as a strong reason why the hospitals should have installed it and should continue to use it the fact that there were only fifty-five hospitals in the country which were concerned, and which had actually installed oil showed that that was not a very powerful consideration The real consideration was the comparative cost of the two kinds of apparatus Not only would this not necessarily cost the hospitals a large sum per annum, but if they followed the example of some very progressive and efficient hospitals which had made the most of the time that had elapsed since the Budget proposals were introduced, they could actually save money Here was a case of a hospital in London where conversion from oil to coke had actually taken place since the oil duty was first proposed The total cost of conversion was £80 and the estimated annual saving due to the use of coke was £2 000 so that in two weeks the hospital would have paid off the extra cost of conversion and would be in receipt of an additional source of income which was never thought of before In the case of a much larger hospital the cost of conversion was no less than £680 and they were going to save £1 670 The relative improvement was not so great as in the first case but the capital expenditure would be paid off in five months and the hospital would have a new source of income Conditions varied in different cases and a great deal depended on such technical questions as whether a natural draught was sufficient or whether there would have to be a forced draught With a natural draught the cost

IN RHEUMATIC CONDITIONS



℞

COLLOSOL SULPHUR ʒ VIII
Sig ʒi thrice daily, after meals, in a wine glassful of water

Alternate weekly with
COLLOSOL IODINE ʒ V
Sig ʒ i or ʒ ii thrice daily, after meals, in a wineglassful of water

As auxiliary measures
COLLOSOL SULPHUR BATHS
ʒ IV mitte VII
Sig one bath every fourth day

COLLOSOL IODINE OIL ʒ I
Well rubbed in every night

The success of Collosol Iodine and Collosol Sulphur used separately indicated that as both drugs fill an important place in the treatment of infective and other conditions such as Early Rheumatoid Arthritis, Muscular Rheumatism, Fibrositis, Sciatica, etc., by alternating the treatment a valuable addition to the armamentarium of the practitioner would be afforded Actual clinical results prove that the combination does produce the results expected from theoretical considerations

COLLOSOL IODINE is unaccompanied by the disadvantages usually associated with iodine treatment It remains stable in the gastric and intestinal juices and is absorbed in the tissues

COLLOSOL SULPHUR, unlike the ordinary pharmaceutical preparations of sulphur, readily combines with proteins in the intestinal tract and is entirely absorbed

CARBON DIOXIDE

one of the latest advances in the treatment of HAY FEVER AND ASTHMA

For the treatment of hay fever and asthma, carbon dioxide may very conveniently be administered by the "Sparklet" Pocket Resuscitator, "J" size, for which a special attachment consisting of rubber tubing and nose-piece is issued The method of administering the gas has been described by an authority * as follows —

In cases of ASTHMA the nose piece should be inserted in a glass of water and Valve Key should then be very slowly turned in an anti clockwise direction until a moderately rapid stream of small bubbles is seen to issue from the tube The nose piece is then dried and inserted into one nostril The patient should breathe through the mouth and the gas should be allowed to flow into the nose without being actually inhaled

In HAY FEVER the treatment prescribed should be followed for five minutes up each nostril every morning throughout the hay fever season and in addition the gas should be used as often as necessary during the day if an attack seems imminent and its use continued until the symptoms cease For paroxysmal sneezing and nose running the treatment should also be followed immediately an attack begins In cases of asthma which begin with an attack of this nature the gas may prevent the attack from developing

General Medical Council's Registrar—Mr HORE BELISHA announced on June 14th that the post of Joint Registrar of the General Medical Council and of the Dental Board had been recognized as approved employment within the meaning of the Superannuation Act 1914

Superannuation of Local Government Officers—In the House of Commons on June 20th the Local Government and other Officers Superannuation (Temporary Provisions) Bill was read a second time The Bill makes provision for certain deductions from remuneration to be disregarded in the computation of contributions, pensions and gratuities under enactments relating to the superannuation of persons employed by local authorities and other public bodies The Bill was supported by Mr SHAKESPEARE and Mr GREENWOOD both of whom said it legalized an honourable undertaking entered into by local authorities with their employees who agreed to cuts in salaries Sir HENRY JACKSON welcomed the Bill on behalf of the National Association of Local Government Officers as evidence of the interest which the Government and the Ministry of Health were taking in the officers of the Local Government service It was he added the first occasion on which the Government of the day had introduced a superannuation bill dealing with Local Government officers The Bill was committed to a Committee of the whole House

Examination of Blind Persons in Scotland—Replying to Mr Burnett Sir GODFREY COLLINS said on June 20th that in all cases which came before the Department of Health of Scotland on appeal where examination had been made at a blind clinic the Department were furnished with detailed reports by the examining surgeons These specialists were fully conversant with the standards adopted for the purposes of the Blind Persons Act 1920 and their reports formed the basis of the Department's decisions If in any case of special difficulty further examination was thought desirable arrangements would be made to have this done

The Services

INDIAN MEDICAL SERVICE ANNUAL DINNER

The annual dinner of the Indian Medical Service took place at the Trocadero London on June 14th with Air Vice Marshal Sir David Munro in the chair The official guests were Sir Findlater Stewart Permanent Under-Secretary of State for India Major General S F Muspratt Military Secretary India Office Dr N G Horner Dr E C Morland, and Mr F H Brown together with six officers on probation

The chairman in proposing the toast of "The Service," read a message of greeting from I M S officers in Lucknow and said that he was proud to preside at the dinner of his own Service the finest in the world In the great variety of its work—clinical scientific and administrative—the I M S was unrivalled and its officers were in touch with the life of the people of India The medical problems of India were immense and for their solution humanity would require the continued efforts of the I M S Sir David Munro ended with a brief tribute to the memory of Sir Walter Fletcher a man with a flair for the best of everything and a good friend to the I M S

Sir Leonard Rogers in proposing the chairman's health said that the prospects of the I M S were better now than for some years past Twenty five recruits with high qualifications had joined this year In former times the greatest attraction of the I M S was the opportunity it gave for research in the sciences such as botany zoology and ethnology Nowadays with the extreme specialization of the sciences this was no longer possible but the career of Sir David Munro illustrated the versatility of the I M S

The health of the secretaries Colonel Granger and Sir Carey Evans and of the Indian secretary Colonel Stanger-Leathes was proposed by Lieut Colonel J Anderson who mingled good advice with humorous anecdotes in his inimitable manner and expressed the thanks of the company to those who had organized a most enjoyable evening Sir Carey Evans in a brief response spoke of the death of two great I M S men of science during the past year—Sir Ronald Ross and Colonel Alcock

The officers present at the dinner were

Treat RHEUMATISM Through the Skin

There are no risks, no cardiac complications and no contra-indications with

'IOBRINE' (REGD)

SEAWEED BATHS

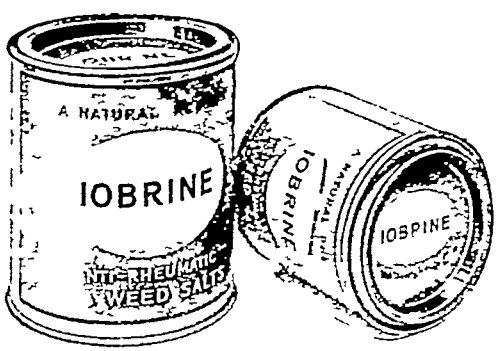
A simple remedy of exceptional efficacy for alleviating articular and muscular pain and stiffness in practically every manifestation of the rheumatic and gouty diatheses

Iobrine Seaweed Salts is a highly concentrated product containing the total salts with the free iodine and active principles of specially selected seaweed. It does not irritate or stain

Numerous reports received from the medical profession prove Iobrine to be a boon to patients and a valuable acquisition to modern therapy

Iobrine may be used as a complete bath or a local compress according to the condition to be treated.

SOME INDICATIONS — Rheumatism (articular and muscular) lumbago general stiffness after exercise, neuritis gout, fibrositis etc., etc.



Doctors say—

Cowdenbeath Aug 6th 1932
"I tried IOBRINE on a case of acute rheumatic joint condition in a young girl of 12, in the form of hot fomentations The results were very gratifying as it was very soothing to the patient, and greatly alleviated the pain. The parents procured further supplies for themselves till the treatment ended with satisfactory results to the child." M.B

Oxford, Oct. 7th, 1932.
As I was suffering from Lumbago myself a condition I have been subject to since I sprained my back a few years ago I used the IOBRINE in two baths I am pleased to report that I received great benefit from them, the pain and stiffness in the muscles subsiding and the general tonic effect was very noticeable. M.B., Ch.B

Glasgow Dec 14th, 1932.
I may say that I have found hot IOBRINE BATHS to give great relief to tired aching limbs and to be conducive to sleep
SURGEON

Golder's Green, N.W.11
Dec. 18th 1932.
My wife who suffers from Muscular Rheumatism has found considerable relief from using your IOBRINE SEAWEED BATH SALT and I can certainly recommend it." M.B

Harrogate June 12th 1932.
Re IOBRINE, I may say that it is in my opinion a very useful form of treatment for Rheumatism I tried the sample you sent me on a patient who was very pleased with the results. M.R.C.S. L.R.C.P

QUERIES AND ANSWERS

Gerard's "Herball"

Dr. W. DARLEY HARTLEY (Rondebosch, Capetown) writes: I have in my possession a copy of Gerard's *Herball*, that great volume of Elizabethan materia medica, published in 1597 and printed by John Norton at London. I should be very grateful if any of your bibliophile readers could inform me what edition of Gerard this is, and whether copies are rare. If they could at the same time give me any particulars about the author himself I would be grateful. I have been asked to show the book at a historical exhibition arranged for the ensuing South African Medical Congress in September, and any information would be of value. It contains a dedication to Lord Burghley.

*** John Gerard was born in 1545 at Nantwich and died in 1612 in London. At the age of 17 he was apprenticed to Alexander Mason, a surgeon in large practice and twice Warden of the Barber Surgeons Company of which Gerard was admitted a freeman in 1569 and a member of the Court of Assistants in 1595. Gerard was by then well known as a skilled herbalist; he was superintendent of Lord Burghley's gardens in the Strand and at Theobalds in Hertfordshire. In 1596 he published a list of the plants cultivated in his own garden in Holborn. In December, 1597, appeared the folio volume which has made his name a household word, his *Herball*. The original of this was the *Stirpium Historiae Pemptades* (1583) of Rembert Dodoens of Malines with many of Gerard's own remarks inserted such as localities for scarce plants in various parts of England and allusions to persons and places. In 1633 Thomas Johnson prepared a new edition of the *Herball* which was reprinted word for word three years later. The genus *Gerardia* was named by Linnaeus in memory of Gerard. In 1639 the Barber Surgeons Company of which he was Master in 1608 paid 25s. 6d. for a copy of the *Herball* for its library. Further information will be found in the article on Gerard in the *Dictionary of National Biography*.

Vehicle Sickness

YORKSHIRE writes: A woman patient suffers from vomiting every time she rides in her husband's motor car. She states she has suffered ever since she can remember, when riding in trains, buses, and trams. No treatment seems to benefit her. Can anyone having experience of similar cases suggest a remedy?

Nocturnal Enuresis at Menopause

O. OKIEP (London, W.) asks for suggestions in the treatment of spasmodic nocturnal enuresis in a woman aged 55. Menstruation has been absent for some months past, though it has recently been present—scanty and irregular in character. No other abnormalities physical or psychical.

Alopecia Areata

"A. A. H." writes: I have a patient with alopecia areata who has seen everybody in this part of the world and tried all the usual remedies—with no avail. The Wassermann reaction is negative. I should be grateful for suggestions as to any recent treatment.

LETTERS, NOTES, ETC.

Tobias Venner and his 'Via Recta"

A correspondent writes: Apropos of your amusing synopsis of some of Tobias Venner's views on tobacco, strawberries and cream, etc. (June 17th, p. 1068) it may interest some of the profession to know that a copy of the 1638 edition of this very book is to be sold at Sotheby's in Bond Street, on July 4th. The abbreviated title, as given in the catalogue, is *Via Recta ad vitam longam*: 'Or a plain Philosophicall Demonstration . . . for the preservation of health . . . a Treatise of the Famous Baths of Bathe . . . as also an accurate Treatise concerning Tobacco.' R. Bishop for H. Hood.' There are a few other old medical books in the same sale. Vesalius, *Anatomy*, Amsterdam, 1617, with forty anatomical plates; Otto Tachenius, *Hippocrates Chymicus discovering the ancient foundation of the late Viperine Salt with his Clavis thereunto annexed translated by I. W.* 1677; Hieronymus Von Braunschweig, *Das Buch zu istilieren*, 1532; Cogan, *The Haven of Health* "Hereunto is added Preservation from the Pestilence, with a short Censure of the late Sicknesse at Oxford" 1589; Luis Lobera de Avila, *Ein Nutzlich Regiment der Gesundtheit* with woodcuts of bloodletting, Augsburg, 1531; Marsilius Ficinus, *De Triplici vita libritres*, Bologna, 1501; and one or two others.

Posture in Labour

Dr. CHARLES J. HILL AITKEN (Rotherham) writes: The late Dr. W. E. Fothergill in his *Manual of Midwifery*, recommended that the legs be down when the head is still above the brim, that the legs be up when the head is in the pelvis, and that the legs be down again when the head is passing the perineum. This procedure will facilitate labour. These positions can be taken up by the patient lying on her left side and on her bed. The manual was published in the late 'nineties.

Portable Lithotomy Support

Dr. SHEILA MACPHERSON asks us to state that the makers in London of the portable lithotomy support, described in the *Journal* of June 17th (p. 1058), are Messrs. Allnatt and Partners. The appliance is also to be obtained from Messrs. J. Gardner and Son, Forrest Road, Edinburgh.

Inflammation after Use of Depilatories

Dr. L. H. FISHER (Brighton) writes: In your Letters, Notes and Answers column of June 17th there is a reference to adenitis following the use of depilatories. Recently I had a similar case, and I have treated at least half a dozen cases in six or seven years. The condition, in my opinion does not appear to be an adenitis. It resembles more a subcutaneous abscess, probably at the root of a sweat gland. In each case there has been two or more present—in one case eight small abscesses about the size of a hazel nut. I consider depilatories to be definitely dangerous.

The A.A. Irish Handbook

The Automobile Association (Fanum House, New Coventry Street, W.1) has now issued its *Irish Handbook* for 1933-4. Particulars are given of all Irish hotels and garages holding the full A.A. appointment and a note is included of houses where hot and cold running water is provided in the bedrooms. Details are given concerning the services to which members are entitled from the A.A. road patrols and departments, and there is a map in atlas form (scale sixteen miles to the inch). Further information covers foreign tours, steamship rates for motor vehicles, times of lighting up for Northern Ireland and the Irish Free State, and formalities in connexion with crossing from the Free State to Northern Ireland and vice versa.

Vacancies

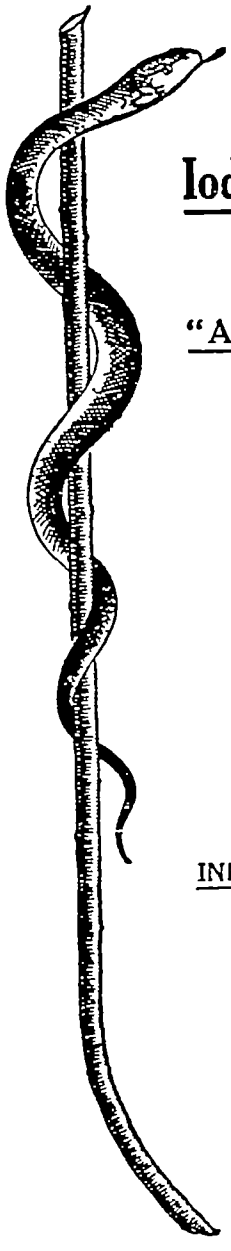
Notifications of offices vacant in universities, medical colleges, and of vacant resident and other appointments at hospitals will be found at pages 42, 43, 44, 45, 46, 47, 50, and 51 of our advertisement columns; and advertisements as to partnerships, assistantships, and locumtenencies at pages 48 and 49.

A short summary of vacant posts notified in the advertisement columns appears in the *Supplement* at page 296.

THERAPEUTIC NOTES

from

Oppenheimer Son & Co Ltd



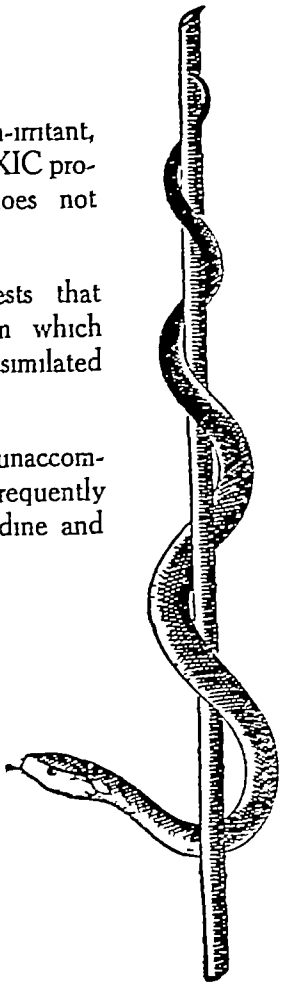
Iodine Therapy

"ALPHIDINE"

ALPHIDINE is a non-irritant, relatively NON-TOXIC product of Iodine which does not cause Iodism

Clinical experience suggests that the Iodine is in a form which is readily taken up and assimilated by the Thyroid Gland

Its administration is unaccompanied by depression so frequently caused by the ordinary Iodine and the Iodides



INDICATIONS —All those conditions arising from a subnormal Thyroid.

HYPERTENSION, ARTHRITIS,

RHEUMATIC CONDITIONS generally

Also valuable in fatty infiltration

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine

438 Arterial Blood Pressure during Attacks of Angina

SAMUEL A LEVINE and A CARLTON ERNSTENE (*Amer Heart Journ* February 1933 p 123) report their observations on arterial blood pressure during attacks of angina pectoris Readings were obtained in spontaneous attacks occurring in twenty three patients In seven the previous blood pressure readings were known In three the attacks were allowed to end spontaneously and in twenty nitroglycerin was given to obtain relief In every case the systolic pressure was distinctly higher during the attack Although this may not be an invariable occurrence it is concluded that a failure of the blood pressure to rise in an anginal attack is rare Evidence is presented to show that in patients with angina pectoris pain alone such as that of renal colic neither produces an elevation of the blood pressure nor brings on an attack of angina It is suggested that a temporary elevation of the blood pressure is an important factor in the production of anginal attacks and may even be a necessary immediate cause of the attack although a final decision as to this relation will require further investigation

439 Spontaneous Subarachnoid Haemorrhage

C K RUSSEL (*Canadian Med Assoc Journ* February 1933 p 133) has encountered twenty six cases of this disease and believes that it is too often overlooked despite the distinctive clinical picture The average age of these patients was 38 the eldest was 69 and the youngest 12 Recurrent attacks were noted in some cases Fourteen patients were women and twelve were men In five instances the haemorrhage was associated with pregnancy In three of these there was renal toxaemia and hypertension but of too short duration to suggest such a sequel Only in one case in the whole series was there a suspicion of vascular syphilis and in none was there evidence of thrombosis of the longitudinal sinus Russel considers that developmental defects are the underlying factors in the majority of the cases The onset is always sudden Headache begins in the frontal region but soon becomes occipital also and frequently spreads down the neck and back It is often associated with vomiting but the headache being severe is always the outstanding symptom Consciousness may be dulled or lost in the first case the patient when roused is rational and not toxic as in an infective meningitis In coma or semi-coma supervenes there is still evidence of extreme irritability A generalized convulsion occurred in two cases in the series The temperature is normal at first but may rise slightly later due probably to the absorption of the blood There is definite stiffness of the neck on passive movement especially obvious if an attempt is made to flex the head on the chest Kernig's sign is present in the more severe cases but there are as a rule no paralyses and no pathological reflexes In half the series there was slight blurring of the optic disks and in one third definite haemorrhages were seen in the fundi Albuminuria was present in 50 per cent but in no instance in very great amount This sign disappeared before healing was complete The leucocyte count averaged 11 000 The blood pressure was usually on the high side Lumbar puncture clinches the diagnosis The spinal fluid is under increased pressure and its colour ranges from pink to that of pure blood It does not clot and on standing the cells sink to the bottom of the tube the supernatant fluid remains coloured by altered blood pigment Withdrawal of the fluid relieves the headache but the intracranial pressure must not be lowered too rapidly at one time nor too soon after the onset and before a clot has had time to form at the bleeding point Yet it is important to remove as much as possible of the blood in view of possible complications later such as the formation of an interstitial hydrocephalus The disease was of the meningitic type in fourteen of the twenty six cases at the onset with symptoms of meningeal irritation In ten cases however either at the onset or subsequently a second haemorrhage occurred which had the character of an apoplexy causing a hemiplegia Spontaneous subarachnoid haemorrhage is most frequent at the junction of the anterior cerebral and the anterior communicating arteries Developmental aneurysms are attached by the author to this fact but in the older patients acquired disease is more commonly the cause Advanced atheromatous changes occur with surprising frequency even in young persons

440 Spontaneous Serum Sickness

W MIKULOWSKI (*Arch de Méd des Enf* March 1933 p 161) who records two illustrative cases states that spontaneous absorption of the patient's own albumin may under certain conditions produce serum sickness and a joint reaction The first patient was a boy aged 8 suffering from tuberculous peritonitis who on absorption of the peritoneal effusion developed a transient and painful oedema of several joints a haemorrhagic eruption and urticaria accompanied by leucopenia hypochromia and oliguria The second patient was a girl aged 8 years suffering from tuberculous pleurisy and peritonitis who developed arthralgia in the cerebral joints and upper limbs accompanied by generalized urticaria as the effusion became absorbed

Surgery

441 Plastic Surgery in Chronic Radio-Dermatitis

Sir HAROLD D GILLIES and A H MCINDOE (*Brit Journ Radiol* March 1933 p 132) describe the treatment of chronic radio-dermatitis and radio-necrosis by plastic surgery Analysis of the records of their patients shows that they fall naturally into three groups (1) patients who have received a single dose of radium or x rays for diagnosis or treatment (2) patients who have undergone treatment for a chronic condition and who have received small but oft repeated doses for a long period often resulting in ulceration and (3) professional workers with x ray apparatus suffering from burns of the hands and face It is stated that the full effects of excessive radiation may not become apparent at once and a latent period of months or even years may intervene between the last dose of x rays and the final breaking down of the tissues The hopelessness of conservative treatment is stressed and the necessity is urged for adequate excision of all the devitalized tissues at a suitable time in order to prepare a healthy foundation for immediate grafting The indications for operation are (1) pain itching ulceration and discharge (2) deformity from contraction (3) cosmetic appearance and (4) epithelomatous change Treatment falls naturally into two stages (*a*) excision and (*b*) repair and in the vast majority of cases both stages are carried out at one operation Excision is usually simple and should extend into healthy skin on all sides A guide to the depth of excision is furnished by traction on the ruddy line supervening which a cleavage plane which is easily followed being thereby established Three methods of repair are available (1) Thick razor grafts these applied on a Scott pressure mould of the defect have a wide field of use (2) Full thickness dissected grafts these in the writers hands have not proved as reliable in this type of repair as the first method (3) Pedicle flaps these may be of the sliding rotation transposed or tubed pedicle variety according to the difficulties to be overcome and the

cosmetic result desired The results in the authors' hands are excellent, and many illustrations of cases are given proving this It is noteworthy that radio-dermatitis and necrosis are cured as soon as excision is complete, and the relief of the pain is usually immediate and permanent Success thus depends entirely on the technical excellence of the plastic treatment In general it may be said that the results are most favourable with thick razor grafts and flaps, and that a successful repair in this type of burn may be more confidently predicted than after burns by fire

442 Ambulatory Treatment of Fractures of the Instep

Of the various fractures of the tibio-fibular mortise J DELCHEF (*Journ de Méd de Bordeaux*, March 20th, 1933, p 223) deals only with Dupuytren's Though it is generally agreed that these are caused by a movement of abduction, he does not concur in the usual method of treatment by placing the foot at rest for some time in a position of hyperadduction For some twenty years he has employed an ambulatory method, and immobilizes the foot in an anatomical position as recommended by Lorenz-Bohler, but without the stirrup used by the latter The following is his technique After determining the lesions by clinical and radiological examinations, local anaesthesia is produced by the interfragmentary method of Quenu, 10 c cm of a 1 per cent solution of scurocaine being injected amongst the fragments Should much swelling be present this may be reduced by massage The patient sits with the injured limb on a table The surgeon also seated, grasps the foot, the homologous hand holding the calcaneum between the thumb and index finger, the other firmly holding the mediotarsus with the thumb under the sole and the fingers on the back of the foot An assistant exercises contra-extension at the popliteal space Reduction, which is usually easy, is made by traction on the calcaneum and metatarsus, the displacement being most frequently corrected automatically When the fracture includes a posterior marginal fragment deviation is apt to recur but this is easily overcome A plaster cast, reaching from the popliteal space to the ends of the toes, is then applied, the foot being maintained at right angles to the leg without abduction or adduction Circular bands of gauze fix the toes to the knee The cast is completed by plaster bands very exactly moulded to the foot and upper ends of the tibia and fibula Walking is allowed immediately the plaster is dry The cast is retained for forty-two days, the circulation being carefully watched After its removal a course of massage and thermotherapy is given To prevent the frequent subsequent swelling a boot composed of Unna's gum should be applied and worn for eight days Short notes are given of thirteen cases—in only two was osteosynthesis performed In conclusion, Delchef discusses the logic of this method and the essentials for success, such as the anaesthesia and correct moulding of the cast

Therapeutics

443 Treatment of Post operative Hypoparathyroidism

R ELLSWORTH (*Bull Johns Hopkins Hosp*, February, 1933 p 131) reports in detail a case of this condition and emphasizes the importance of regulating both the intake of calcium and of phosphorus At first the typical symptoms were partly relieved by a daily calcium intake of 2 grams and a limitation of the phosphorus intake to 1 gram The serum calcium content rose, as also did the serum phosphorus Further limitation of the phosphorus intake to 0 27 gram daily resulted in accentuated relief of the symptoms a slightly higher rise in the serum calcium figure and a fall of the serum phosphorus figure towards the normal The patient returned home and resumed her usual life, but the prescribed regime proved to be ineffectual The calcium ingestion was then raised to 5 grams daily by giving calcium chloride relief of the symptoms ensued, associated with a return towards the normal of the serum calcium and phosphorus figures In the course of the condition viosterol was tried, possibly in too large doses (4 c cm daily) The serum calcium rose at first, but then fell, and the serum phosphorus figure was definitely increased with clinical signs of tetany The author thinks it possible that a very high calcium intake ought to have been associated with this administration of viosterol in order that its calcium increasing potentialities might have been realized Magnesium salts were also tried, and some evidence was obtained that a partial inactivation of the blood inorganic phosphorus content resulted The injection of 80 units of parathormone was followed by a prompt and very rapid fall in the serum inorganic phosphorus, with symptomatic improvement, beginning about eight hours after the injection The serum calcium had reached a level of 9 2 mg per 100 c cm twenty-four hours after the parathyroid extract had been administered

444 Treatment of Erysipelas

W VOGEL (*Deut med Woch* March 10th, 1933, p 365) reports good results in severe cases of erysipelas treated with a combination of local applications and serum injections In regard to local treatment he has found ichthyol ointments, confinement to bed, and immobilization of the affected part in general satisfactory Sometimes *x*-radiation is also applied Mild cases heal rapidly and without exception More severe cases with high fever and urgent general symptoms are treated with injections of autogenous serum, omnadin, or horse serum, sometimes collargol and vaccines are used The author points out that whilst all these methods are successful in individual cases there are many occasions on which no improvement attends their use In recent years the author has used a polyvalent anti-streptococcal horse serum (streptoserin) prepared according to Meyer's technique for the immunization of horses with streptococcal cultures and toxins This serum has given excellent results in gynaecological cases of streptococcal infections In erysipelas the dose varies from 20 to 100 c cm intramuscularly, according to the severity of the condition This may be repeated in twenty-four hours In nearly all cases the temperature is down to normal the next day and the symptoms are definitely improved Failure to bring down the temperature is due to insufficient dosage or to abscess formation deeper in This latter is considered so strongly to be the case that the author regards it as of diagnostic importance Whilst the temperature is brought down rapidly and the general symptoms are improved, the local manifestations may be affected more slowly, but even where these latter extend there is always an amelioration of the symptoms

445 Prevention of Chills following Blood Transfusion

According to R LEWISOHN and N ROSENTHAL (*Journ Amer Med Assoc*, February 18th, 1933, p 466) the occurrence of chills after blood transfusion is preventable whether the blood has been citrated or not They refer to investigations by various authors who have shown that chills ensue with the same frequency in both cases, and submit arguments that the addition of the citrate solution has no such predisposing influence in this respect as has been sometimes attributed to it It appears to the present authors that chills and other reactions following intravenous therapy are due to the existence of foreign protein, which is either extraneous matter present in the insufficiently distilled water or the remains of changed blood proteins left in the apparatus from previous transfusions As the result of centralization of the cleansing of the apparatus and the preparation of the solutions by competent persons, a marked fall in the incidence of chills was recorded—namely, from 12 to 1 per cent With such precautions only five cases occurred in a series of 477, and in four of these an error in technique was demonstrable Many of the patients were desperately ill at the time of transfusion The procedure was undertaken by a considerable number of members of the consulting and resident staffs of the hospital concerned, and the

Nutritional Anæmia in Infancy

THE Medical Research Council's report on this subject shows that a large proportion of infants—breast-fed and artificially fed—under twelve months of age suffer from a mild form of anæmia, which readily disappears when adequate amounts of iron are given

■ ■ ■ ■

For use in established cases of nutritional anæmia, "Allenburys" Milk Food with Additional Iron has been prepared containing iron equal to 900 parts per million

■ ■ ■ ■

"Allenburys" Milk Foods ordinarily contain an amount of iron equivalent to that in human milk Cow's milk contains less iron than human milk but the deficiency is adjusted during the process of manufacture.

Salicylic Medication

TR DE MARK 'TABLOID' BRAND
SODIUM SALICYLATE
Physiologically Pure

Reduced facsimile

Presents precise quantities of the salt Conveniently and easily administered

The sodium salicylate used in 'Tabloid' products is physiologically pure

Gr 3	bottles of 25	Actual cts 7½	per bottle	bottles of 100	per cts to 2/5 per bottle
Gr 5	25	8½		100	2/-
0·5 gm	25	1/		100	3/-

1 gm., by Lot of 25 product 2/3 per bottle

'MENTHOFAX'
TRADE MARK BRAND
COMPOUND METHYL SALICYLATE OINTMENT

Contains Methyl Salicylate 50 per cent. Menthol 10 per cent Eucalyptol, 2·5 per cent. Oil of Cajuput 2·5 per cent. Wht Beeswax, 17·5 per cent. and Hydrous Wool Fat, 17·5 per cent

Anodyne, analgesic Superior in penetrating power to liniments Tube packing preserves freshness and potency, prevents contamination and facilitates application

Obtainable in metal tubes at 1/2 each

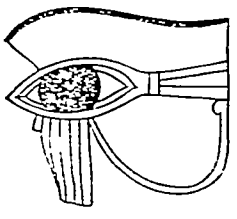
O O O O O

BELIEF IN THE 'EVIL EYE" AS A CAUSE OF DISEASE AND DEATH FIRMLY HELD IN ANCIENT EGYPT—In Egypt amulets against the evil eye, such as shells and forehead pendants have been found in graves of prehistoric times Not only human beings but many animals were believed to "fascinate" with a look. Disease caused by the 'evil eye" was also treated by incantation, which could also prevent the dread glance The "eye of Horus" here depicted, was considered one of the most powerful amulets against "fascination." The underlying idea in the wearing of these amulets was to distract and avert the attention of the "evil eye" from the wearer to the object worn.



DATE From prehistoric times

COPYRIGHT

authors suggest that complete elimination of chills would follow the reservation of blood transfusion to a small expert team which should also be solely responsible for intravenous therapy generally Apart from the proper cleansing and sterilization of the apparatus other factors concerned are the securing of a rapid flow of blood from the donor into the glass receptacle to prevent the formation of small clots and the maintenance of a slow rate of introduction of citrated blood into the recipient Accuracy of blood grouping is also an important safeguard Triple distilled water is indispensable in the preparation of the sodium citrate and normal saline solutions Details are given about the special cleansing of the apparatus and the precautions advisable in securing purity of the fluids for intravenous therapy

Laryngology

446 Ozaena

LEROUX ROBERT and COSTIOL (*Rev de Laryngol d Otol et de Rhinol* February 1933 p 172) review the present knowledge of the aetiology pathology and bacteriology of ozaena They consider the subject from two aspects—the endogenous one in which the patient himself is the determining factor of his affection and the exogenous one in which germ transmission from another individual plays the chief part It has been proved experimentally that implantation of the fetid bacillus does not result in ozaena unless a preceding atrophic rhinitis is present This atrophic condition may be produced by local conditions such as repeated coryza or general diseases such as scarlet fever measles diphtheria and hereditary syphilis The atrophy results from a neuritis by a descending process or by an ascending process affecting the nerve endings The neuritis is dependent on toxins of general maladies The frequency with which such conditions arise at puberty shows that there exists some relation between them and the endocrines The pituitary gland appears to be particularly involved Calcium imbalance also favours the endocrine dysfunction The atrophied condition provides a soil favourable to infection The infection the result of a microbic process determines the odour which heralds the establishment of the malady Certain preventive measures are suggested—the careful examination of the nasal fossa after infantile or puberty infections and a consideration of the possibility of pituitary insufficiency As curative measures autovaccines mono- or polymicrobic vaccines or bacteriophage injections endocrine administration and general treatment are advised Finally local measures in the shape of anatomical or physiological prosthesis including a periarterial sympathectomy in order to produce a humidification of the mucous membrane are indicated

447 Endonasal Radical Operation on the Antrum

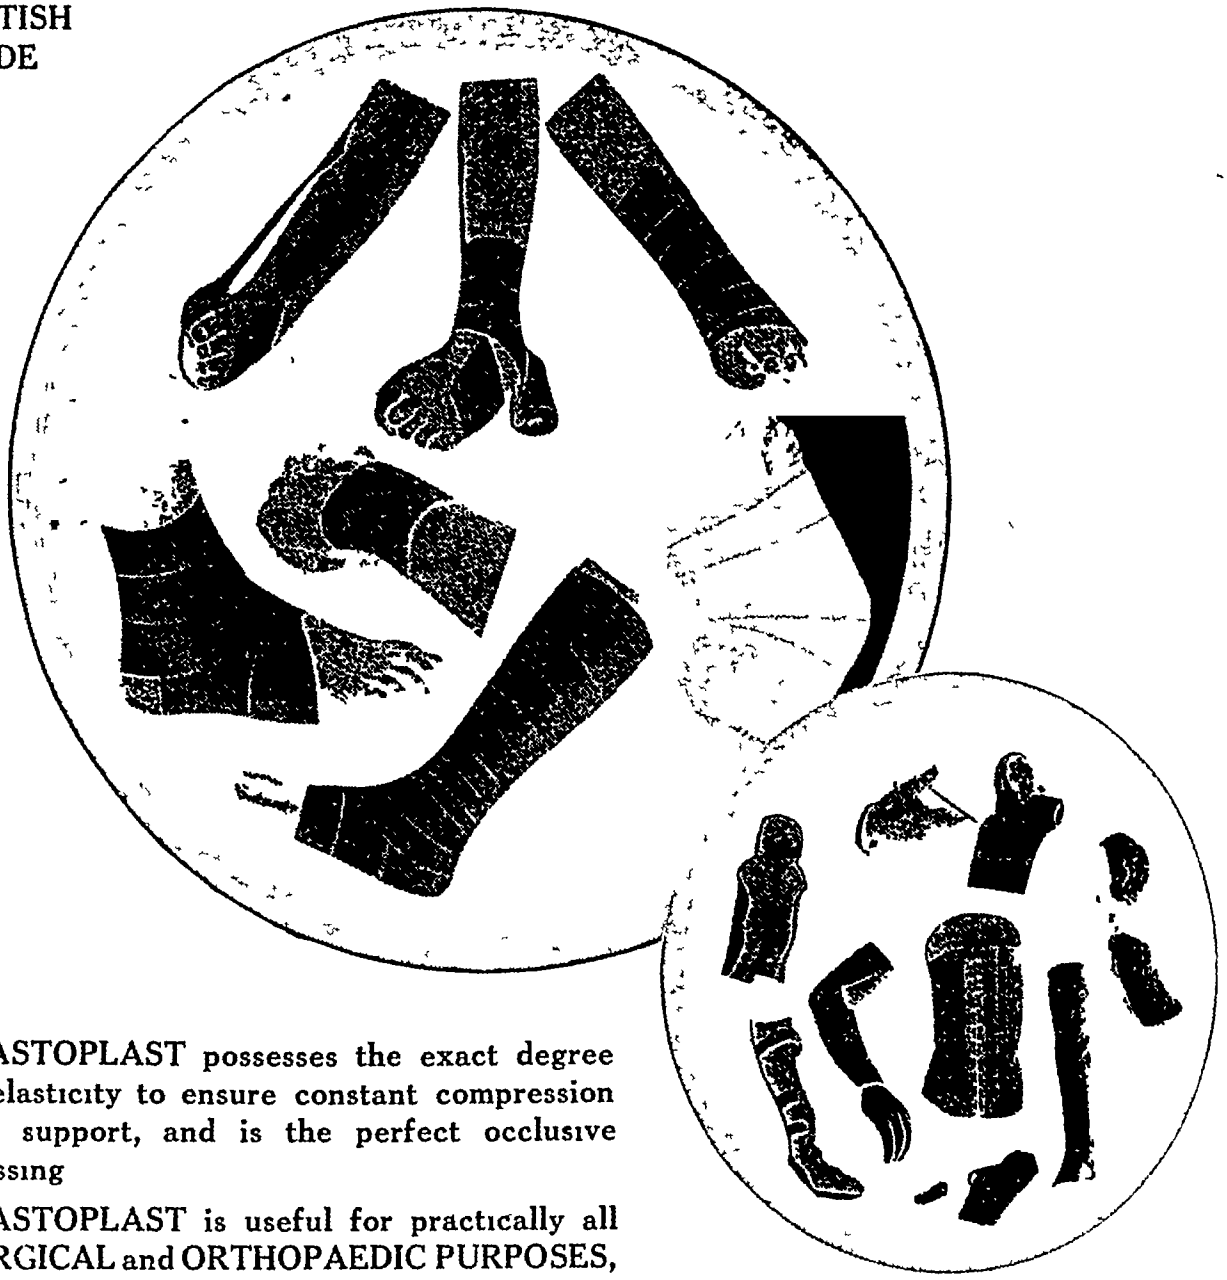
A WACHSBERGER (*Arch of Otolaryngol* February 1933 p 222) describes and commends a modification of the radical operation on the maxillary antrum which was first suggested independently in 1908 by both Canfield and Sturman The advantage of this procedure is that the oral incision is obviated the operation being performed entirely through the nostril The present authors consider that this line of approach is indicated whenever a radical operation on the antrum is required unless a combined oral and nasal approach is preferable as it is in cases in which there is a tumour formation—particularly a large tumour of suspected malignancy—and also in cases of dental origin in which there is involvement of the alveolar process of the upper maxilla such as osteomyelitis occurring after the extraction of a tooth The incision is made in the nasal vestibule in the fold which forms between the pyriform crest and the ala when the speculum is inserted and spread It starts at the level of the insertion of the inferior turbinate and is drawn downwards and parallel with the pyriform crest to the level of the nasal floor the periosteum being simultaneously incised Joseph's elevator is employed to separate the soft parts of the cheek from the bony facial antral wall but the exit of the infra-orbital nerve must not be exposed lest severe post-operative pain ensue The present author unlike Sturman limits the separation to the extent of the inferior meatus stopping at the insertion of the inferior turbinate A speculum is now introduced to reveal the medial and outer antral wall and these are opened with Halle's largest circular trephine placed firmly against the facial wall at a point as far laterally from the pyriform crest as possible and at the level of the mid-section of the inferior meatus The opening can also be made by a gouge The cavity can now be viewed and the degree of pathological change be estimated The opening is then enlarged by removing the facial antral wall medial to the original opening the crista pyriformis and the bony naso-antral wall as in the Denker operation When enough has been removed the interior of the antrum is fully exposed for observation and curetting The final stage in the operation is the cutting of a flap by an incision along the attachment of the inferior turbinate the tip of which need not be excised No packing is used There may be some swelling of the cheek on the second day but this is less than with the Denker operation Wachsberger claims that the avoidance of the oral incision prevents the formation of any bucco-antral fistula through which the stratified squamous epithelium of the oral cavity may grow into the antrum thus delaying healing and establishing a non-physiological condition in the antrum Similarly lodging of food in the antrum and inability to blow the nose properly are obviated nor is there any necessity for secondary plastic procedures to close a pathological fistula The inferior turbinate is retained intact and does not interfere with any inspection of the cavity which indeed is facilitated by the removal of the pyriform crest This removal also permits direct ventilation by the inhaled air which is beneficial for the promotion of healing The author has had gratifying results from this method in over eighty patients

Obstetrics and Gynaecology

448 Total and Subtotal Hysterectomy

Referring to the different opinions as to the choice between total and subtotal hysterectomy J OKINCZYC (*Ginecol et Obstét* March 1933 p 215) states his opinions on the subject basing his conclusions on 365 personal cases These gave a mortality of sixteen (4·12 per cent) The subtotal operation was performed in 256 cases with seven deaths (2·7 per cent) and the total in 132 with nine deaths (6·8 per cent) In 211 cases of fibromata treated by hysterectomy four deaths (1·8 per cent) occurred 164 subtotal operations were performed with three deaths (1·8 per cent) and forty-seven total with one death (2·1 per cent) In eighty-one cases these tumours were associated with other conditions such as salpingitis pregnancy cancer etc A study of these figures and of the causes of the deaths does not show a preference for either operation nor does it indicate that an error had been made in the one chosen For other affections ninety one subtotal hysterectomies were performed with four deaths (4·3 per cent) and eighty six total with eight deaths (9·3 per cent) Though one fatal case in the former group might have benefited by a total operation an analysis of the causes of these deaths does not indicate any preference for the one or other procedure In only eighty-one cases was hysterectomy performed for salpingitis as this condition is better treated by more conservative methods Okinczyc states that the choice of operation is often rendered difficult by the fact that cases in which the total method is the more indicated are precisely those of more difficult if not impossible execution He believes that the indications for total hysterectomy lie less in the pelvis than in the vagina and that the condition of the cervix should determine the choice of operation The total is indicated when the

BRITISH MADE



ELASTOPLAST possesses the exact degree of elasticity to ensure constant compression and support, and is the perfect occlusive dressing

ELASTOPLAST is useful for practically all SURGICAL and ORTHOPAEDIC PURPOSES, as well as in the treatment of IMPETIGO, HERPES ZOSTER, secondary treatment of BURNS and other conditions.

cervix is suspicious, being large, hard, infected, and adenomatous The subtotal is the choice where pelvic indications alone exist, in these cases drainage can be made to the vagina by posterior section of the stump after excising the cervix Little importance is attached to secondary cancerization of the stump The after-effects of each operation show no advantage in favour of either The author maintains that both are excellent, each has its advantages, disadvantages, and indications, and the choice must be governed by the conditions in each individual case

449 Persistent Corpus Luteum

M REEB (*La Gynécol*, February, 1933, p 65) reports two observations of cases with disturbance of menstrual function due to retention of the corpus luteum A woman, aged 35 had had one previous confinement, premature at the seventh month, and one miscarriage at three months Present cessation of menses dated from two months Her general condition was good, Wassermann reaction negative blood pressure 130/85, the urine showing traces of albumin without casts Drops of colostrum were present in the breasts, and the vulva and vagina presented the typical violet coloration The cervix was softened, uterus anteflexed, enlarged, and soft Hegar's sign was positive To the right of the uterus was felt a cystic tumour, very mobile, and round like a small orange The left adnexa were normal A diagnosis of a two months pregnancy complicated by a right ovarian cyst was made At operation several days later there was found a pedunculated cyst of the right ovary, and the very soft uterus corresponded to a three months' pregnancy In the piece removed was a large corpus luteum 22 by 18 by 12 mm Histological examination of the corpus luteum showed it to be in the stage of proliferation and vascularization, the lutein cells were grouped in lobules, the central coagulum was not organized The cyst was a unilocular Wolffian cyst Three days after the operation a slight loss of blood appeared This lasted for three days and scrupulous examination revealed no clots, ovarian debris, or uterine shreds It was then thought that the pregnancy was continuing On the thirteenth and again on the fifteenth day after operation the uterus was found to be of normal size and quite hard The violet coloration had disappeared and an Aschheim-Zondek test was negative The conclusion reached was that the pseudo pregnancy was caused by the abnormal persistence of the corpus luteum, the progestin maintaining the uterine mucosa in its pregravid phase The operative removal of the corpus had acted on the uterus in the same way as its spontaneous regression The second case quoted illustrates the results of hyper secretion of the lutein hormone over a long period —namely delayed menses and pseudo pregnancy Slight excess only of the hormone produced membranous dysmenorrhoea

Pathology

450 The Gono-reaction

The gono-reaction stands in the same relation to gonorrhoea as the Wassermann does to syphilis It is a reaction of complement deviation revealing the presence of gonococcal antibodies According to P BARBELLION and Mlle LEBERT (*Journ d Urol* February, 1933 p 97) the four essentials for the reaction are antigen, the test serum the alexin and a haemolytic system The antigen is obtained from gonococci treated by various agents, an alcohol potassium antigen gives excellent results A good antigen must be prepared from numerous strains of gonococci The test serum is procured from 10 c cm of the patient's blood, this is placed on ice and the serum withdrawn after coagulation The alexin, a thermolabile substance is obtained from any fresh serum, such as the guinea-pig's The haemolytic system is composed of washed defibrinated sheep's red cells and an anti-sheep serum which is prepared by injecting sheep's red cells into a rabbit The alexin and haemolytic system must be accurately dosed The results of the gono-reaction obtained by various workers are summarized A study of these reveals the following facts a strongly positive Wassermann can give a positive gono-reaction though gonococci be absent (therefore, the former should be done concurrently with the latter), a negative reaction is important in the diagnosis of cure provided that the patient has had a previously positive one, during pregnancy and the puerperium the test is of no value, meningococci give a negative reaction, but the *Micrococcus catarrhalis* gives a slightly positive one in 10 per cent of cases The present authors describe their technique for the test, which is similar to that employed in the Wassermann In conclusion, they state that the reaction becomes positive about the third week of the infection, and is always positive in complications, especially in articular localizations It remains positive during the whole course of the disease and often for two months after apparent cure, if the reaction does not become negative at the third month cure is doubtful The test, while not absolute is of value in determining the presence and cure of gonorrhoea, particularly in females It is useful as a prenuptial test, and also in determining the aetiology of a rheumatism, epididymitis, or urethritis

451 Alimentary Value of Lactic Acid

J A COLLAZO J PUYAL, and I TORRES (*Anales de Medicina Interna*, February, 1933, p 133), in order to determine whether the lactic acid formed in the intestine by acidophilous flora is absorbed and passes into the blood as an alimentary product, investigated its assimilation and toxicity by administering it to rabbits by mouth, and then estimating the lactic acid and glucose in the blood The results were as follows Lactic acid and its salts could be tolerated in amounts of 5 to 6 grams per kilo without causing any severe disturbance The curve of the lactic acid in the blood reached a maximum level of 200 to 250 mg per cent compatible with the life of the animal Symptoms of intolerance then appeared, such as dyspnoea, tachycardia, and excitement The amount of glucose in the blood showed a rise corresponding to that of the lactic acid in the proportion of 20 to 50 per cent of the initial fasting value

452 Relation between Streptococcal Antitoxin and Antistreptolysin

E W TODD, L J M LAURENT and N G HILL (*Journ Path and Bact*, March, 1933, p 201) examined fifteen antistreptococcal horse serums, and found that in eleven of them the antitoxin titre was more or less proportional to the antistreptolysin titre In two of them the antitoxin titre was high while the antistreptolysin titre remained comparatively low, and in a further two the relation was reversed, the antistreptolysin titre being exceptionally high in the presence of a low antitoxin titre Ten mild cases of scarlet fever, untreated by antiserum, were then studied, the Dick test being performed at weekly intervals and the blood serum examined at the same time In all the cases the Dick reaction changed from positive to negative between the first and the second week This change was accompanied in six cases by a corresponding rise in the antistreptolysin titre, while in four of the cases no increase in antistreptolysin was apparent during a period of three weeks A further corroboration of the independence of antistreptotoxin and antistreptolysin was obtained by a study of twelve convalescent rheumatic fever patients who had remained Dick positive The serum of eight of these cases had normal antistreptolysin titres, while the serum of the other four cases had abnormally high titres—higher, in fact, than the serum of any of the Dick negative scarlet fever patients in their second week of illness It is known that many strains of haemolytic streptococci may produce a large amount of filterable haemolysin in serum broth cultures, and yet form only small quantities of Dick toxin as measured either by skin reactions in sensitive persons or by lethal effects on rabbits It is therefore concluded that the antibodies formed to the haemolysin and the toxin are distinct

You can recommend Odol because it is safe.....

Odol Tooth Paste has earned the approval of Dental and Medical Practitioners not merely because it is an effective, antiseptic dentifrice, but also because it is *safe* — even for young children's teeth

In the desire to remove quickly all surface dirt, stains or tartar there is sometimes a tendency to resort to abrasive pastes or powders which eventually have a highly detrimental effect upon the enamel and only a smooth, *triple milled* tooth paste such as Odol is, can be safely recommended

Odol is in my opinion the finest dentifrice I have ever used, and I have sampled many I have often recommended it to my patients and have found it very efficacious
(Signed) M C , M R.C S (Eng) L.R C P., London.

Your Tooth Paste is most refreshing and is really efficient, your Mouth wash also I have no hesitation in recommending both
(Signed) The Principal of a Dental Hospital.

I find from personal experience that it is the only Tooth Paste on the market that really cleans teeth
(Signed) A London Dentist.

After a thorough personal test I have no hesitation in saying that in my opinion it is by far the best preparation of its kind and I will certainly recommend it to all my patients
(Signed) L.D S , R.C.S

A generous supply of trial samples sent on receipt of Professional Card

CAUSATION AND TREATMENT OF ARTHRITIS AND ALLIED CONDITIONS

REPORT OF THE B M A COMMITTEE

The Council of the British Medical Association on November 11th 1931 appointed a special committee for the promotion of research into the causes of arthritis and allied conditions and the investigation of methods of treatment etc with the following reference—

(1) *To correlate the present knowledge of chronic arthritis and allied conditions*

(2) *To report on the methods at present in use, and the organizations at present existing both at home and abroad for the treatment of these conditions*

(3) *To report on the directions in which future research into these conditions can be undertaken with most probable profit and the means whereby such researches may be directed and correlated*

(4) *To report on the means whereby a knowledge as to early diagnosis prevention and treatment of these conditions may best be disseminated amongst the medical profession*

The Committee consisted of—

SIR HUMPHRY ROLLESTON Bt, M D F R C P *Chairman*
R G GORDON M D, D Sc F R C P Ed *Vice-chairman and Honorary Secretary*
W G WILLOUGHBY M D
E K LE FLEMING M B B Ch
SIR HENRY BRACKENBURY LL D M R C S
N BISHOP HARMAN LL D F R C S
C W BUCKLEY M D F R C P
JOHN FREEMAN M D
L G GLOVER M D
A H GODSON F R C S
MERVYN H GORDON M D, F R S
C O HAWTHORNE M D D Sc LL D, F R C.P
A P LUFF M D F R C P
G L KERR PRINGLE M D
MATTHEW B RAY M D
S GILBERT SCOTT M R C S D M R E
F G THOMSON M D F R C P
SIR WILLIAM H WILLCOX M D F R C P

PRELIMINARY

The Committee met on eleven occasions and the Drafting Subcommittee on five occasions

The Committee has sought to fulfil its reference under the following headings

I Nomenclature and classification
II Clinical features
  (*a*) Primary rheumatoid arthritis
  (*b*) Secondary rheumatoid arthritis
  (*c*) Chronic villous arthritis
  (*d*) Osteo-arthritis
  (*e*) Spondylitis
  (*f*) Fibrositis
III Incidence
IV Aetiology
V Morbid anatomy
VI Biochemistry
VII Radiology
VIII Differential diagnosis
IX Treatment
  (*a*) Prophylaxis
  (*b*) Vaccines
  (*c*) Drugs
  (*d*) Endocrine preparations
  (*e*) Diet
  (*f*) Physical methods
    (i) General
    (ii) Electrical and *x* rays
    (iii) Mineral waters and baths
  (*g*) Climate and Hygiene
X Orthopaedic and Surgical
XI National schemes for treatment
  (*a*) In certain Continental countries
  (*b*) Suggested scheme for Great Britain
XII Observations on advertised remedies
XIII Indications for future research
XIV Suggestions for further professional education

I. NOMENCLATURE AND CLASSIFICATION

At the outset the Committee was faced by the difficulties of nomenclature and classification The term arthritis and allied conditions includes many different manifestations of disease among these are some which can neither be sharply defined nor their cause or causes be regarded as other than uncertain As an aetiological classification is in the present state of knowledge impossible the Committee has adopted as the most practical solution a clinical grouping though this is admittedly unsatisfactory in some respects Further as the titles applied to various forms of joint disease are confusing the Committee while preferring those familiar in British practice prints also the corresponding synonyms employed in some Continental countries and in the United States

The Committee has excluded from the scope of its inquiry the joint affections of

(1) Acute and subacute rheumatism
(2) Specific infections such as those dependent upon gonococcal pyogenic enteric and dysenteric organisms and those associated with the exanthemata
(3) Metabolic and haemopoietic diseases—for example gout haemophilia purpura and
(4) Organic nervous diseases—Charcot's joints

The following is the clinical grouping adopted by the Committee

	SYNONYMS	
Rheumatoid Arthritis	Chronic polyarthritis (*Continental nomenclature*)	*Primary* cause not known this acknowledgment may merge into
	Atrophic (Goldthwait)	
	Proliferative (Nichols and Richardson) (*American nomenclature*)	*Secondary* associated with focal or general infection

	SYNONYMS	
Chronic Villous Arthritis	—	Mainly occurring in women at or about the climacteric
Osteo arthritis	Hypertrophic (Goldthwait)	*Primary* no definite association with infection
	Degenerative (Nichols and Richardson)	*Secondary* associated with infection
Spondylitis	Ankylopoietica	Arthritis of spinal joints, with bony ankylosis, spreading centrifugally to adjacent large joints
	Osteo arthritica	Osteo arthritis of the spine (the labourer's spine)
Fibrositis	Intramuscular and fascial Periarticular Bursal and teno synovial Subcutaneous (panniculitis) Perineuritic	

II CLINICAL FEATURES

(*a*) PRIMARY RHEUMATOID ARTHRITIS

Occurs particularly during the child-bearing period in women who follow indoor occupations

Prodromal symptoms are attacks of cramps or weakness in the muscles, muscular wasting, and paraesthesias and vasomotor disturbances of the extremities—for example, Raynaud's syndrome, sweating, instability of pulse rate, tremors, fatigability

The *onset* may be acute or subacute, with febrile or subfebrile temperatures, in association with enlargement of one or more of the small joints of the hand

The *course of the disease* may be marked by periods of apparent recovery, on the other hand, any influence, mental or physical, which reduces the general health may aggravate the symptoms

Arthritic manifestations commence in the small joints of the hands, which develop a characteristic fusiform shape without much evidence of active inflammation In time many joints become affected, the progress is centripetal, and the distribution shows bilateral symmetry Muscular wasting is extreme, particularly in the small muscles of the hands In advanced stages stiffness, contractures, especially ulnar deviation, and ankylosis, are prominent The patient's general health declines, and such symptoms as anaemia tachycardia sweating, and coldness of the extremities are noted, perhaps also enlargement of neighbouring lymphatic glands The heart, except for myocardial deficiency, is not directly affected

Aetiology is uncertain Foci of infection are not always found, and their removal is not always followed by improvement Vasomotor phenomena and capillary contraction are held to be significant features, and have been attributed to endocrine imbalance

Prognosis Progress is always slow, and intermissions and recrudescences are frequent

Treatment To secure improvement in the general health is imperative The patient must therefore surrender herself entirely to treatment and avoid all unnecessary fatigue

Diet This should be generous, with plenty of fruit and fresh vegetables

Drugs Iodine in milk and small doses of thyroid extract are the most useful drugs Short courses of general tonics such as cod-liver oil sodium cacodylate and iodide of iron are often useful Anodynes and sedatives are frequently indicated

Physical Methods Massage should be applied to the muscles round the affected joints The joints should be gently moved each day, and should be supported and, if necessary, retained in the optimum position by light splints Heat and counter-irritation may be applied to the affected joints by steam mud packs, diathermy, and blisters, but fatigue must be avoided Intrapelvic diathermy has been advocated and found useful

Infective foci, if found, should be treated very cautiously to avoid shock and toxaemia Vaccines in small doses are favoured by some authorities

(*b*) SECONDARY RHEUMATOID ARTHRITIS

There are two clinical types (*a*) with acute febrile onset resembling rheumatic fever, (*b*) with subacute onset, often followed by periods of activity and remission In each the disease is polyarticular, tends to be symmetrical in distribution, and attacks both large and small joints The disease is usually associated with discoverable septic foci, psoriasis also appears in occasional instances to have some clinical relation to it

Age May occur from childhood to long past middle life, most common between 20 and 40

Sex Men and women suffer in approximately equal numbers

Modes of Onset In the acute types several joints are involved early The fingers, wrists, elbows, toes, ankles, and knees are commonly affected, less commonly the shoulders and hips The jaw and the spine are not infrequently involved

Joint Conditions The joints are swollen, and tend to be fusiform, pale in colour, 'doughy" to the touch, tender on pressure, and painful on movement, the range of movement is restricted Localized sweating over the joints is frequently observed The muscles immediately above and below the joint are wasted, the nearest lymphatic glands may be enlarged Well marked distortion of joints frequently occurs

Temperature In cases with acute onset there is fever of varying intensity Subacute cases show periods of slight pyrexia The more chronic cases are usually afebrile or show subnormal temperatures

Blood Secondary anaemia, slight or pronounced, is common Leucocytosis, lymphocytic in type and moderate in degree, is frequent The sedimentation rate of the red cells is always increased (see p 1040)

Circulation The pulse tends to be rapid and the blood pressure low, vasomotor instability and sweating especially of the extremities, are common, the peripheral circulation in the capillaries is sluggish and defective The heart is enfeebled by toxaemia, but endocarditis as seen in rheumatic fever is rare Subcutaneous fibrous nodules are not uncommon

Pathogenesis The sites of infection are in connexion with the teeth tonsils nasal sinuses, middle ear, gall bladder, appendix bowel genital tract prostate uterus and Fallopian tubes, kidney, bladder and bronchial tubes Koch's postulates are not satisfied

Prognosis Many patients especially if treated in the early stages recover completely after removal of septic foci, whereas in others this procedure is of no avail Possible explanations of such failure are (*a*) the removed focus was not the cause of the disease, (*b*) other foci remain though undiscovered Such foci, it is suggested, may exist in the intestine, due to infection from the tonsils or teeth and from them micro organisms or their toxins may enter the blood or lymph stream through damaged intestinal epithelium while at the same time there may be failure of the antitoxic function of the liver Granted the presence of pathogenic organisms in the intestine, such a course of events is possible, but the proposal cannot yet

Dependable Catgut!

claim convincing evidence (c) a third possible explanation of absence of benefit from removal of a septic focus is that sensitization of the joints may have been produced by repeated doses of bacterial antigen perhaps from saprophytic organisms not necessarily pathogenic In some instances general treatment is followed by improvement both of the arthritis and of the infective focus without removal of the latter presumably the natural resistance of the tissues overcomes both pathological reactions

Treatment General measures are (1) Treatment or removal of the infective focus or failing this adequate drainage (for example of the nasal sinuses if these are infected) (2) favourable hygienic surroundings including fresh air and sunshine (3) generous diet not excluding red meat (4) vaccines in some cases (see p 1044)

Treatment of Joints In the acute stage rest to the affected joints is necessary care being taken that they are not allowed to assume faulty positions heat dry or moist either locally to individual joints or if the disease is polyarticular to the whole body by means of baths When the acute phase has subsided massage should be given lightly at first to the joints but freely to the muscles and gradually increased in depth and severity Daily passive movements of the joints are desirable and later active movements

(c) CHRONIC VILLOUS ARTHRITIS

The early symptoms are gradually increasing stiffness and pain in the affected joints (usually the knees) often at the onset worse during rest Later the symptoms become aggravated and walking especially on rough ground or on descending a hill or stairs is difficult Pain and tenderness are particularly severe on the inner aspect of the joint At first the affected joint shows nothing more definite than a slight swelling but on flexion and extension a fine uniform crepitation can be heard or felt As the synovial membrane becomes thickened the swelling is more pronounced it can be noticed below and on each side of the patella and when the knee is extended a tense swelling may be felt in the popliteal space due to distension of a synovial pouch At first there is no muscular wasting later this may be observed in the lower part of the quadriceps A ray examination does not reveal either erosion of the cartilages or bony change Patients are almost invariably inclined to be florid and stout often they show signs of thyroid deficiency especially thinning of the hair and outer halves of the eyebrows and brawny thickening about the shoulders and hips Another feature is the presence of flat foot which develops as the result of defective muscular tone and increasing weight the unusual strain thus thrown on the knee joint may be an element in the causation of the arthritis Heberden's nodes may accompany the disease but there is no evidence that they share with it a common cause

Prognosis With adequate local and general treatment the prospect is favourable

Treatment If the symptoms are urgent complete rest and fixation are necessary in the less severe cases partial rest and a bandage with perhaps a light splint—for example the Howard Marsh form—may be sufficient and counter irritation radiant heat ionization Bier's bandage and local douching are helpful But these local measures will probably fail unless any existing deformity of the foot is corrected or varicose veins if present are treated General measures include thyroid medication and agencies for the reduction or prevention of obesity with sedatives if pain is severe (N B —Schüller's villous arthritis is not discussed because it is held to be due to gonococcal or tuberculous infection)

(d) OSTEO-ARTHRITIS

A disease distinguished by primary degenerative changes in the articular cartilages followed by bony overgrowth in the neighbourhood of the joints mainly the larger joints When a single joint is affected it is rare to find any signs of preceding inflammation (primary form) but when several joints suffer such a history is frequent (secondary form) In each form strain or injury is often in some measure responsible The essential changes are degenerative followed by bony hyperplasias which may or may not cause symptoms The disease occurs in the middle aged and elderly who although healthy in other respects often show evidences of arterial and other degenerations Arteriosclerosis may be well marked in the region of the affected joints The earliest symptom is stiffness experienced after rest and disappearing on movement Pain may be quite absent but if the weight bearing joints are affected it is common particularly after sustained activity The joint is often puffy and tender On active or passive movements a soft creaking can be felt and heard unless there is much synovial effusion This is due either to alteration in the synovial membrane or to thick fluid in the joint Later the cartilages atrophy and bone is exposed and there is coarse grating on movement Muscular spasm restricts movement and muscles near the affected joints waste to some extent and are subject to fibrositis Skiagraphy shows the condition of the cartilage and adjacent bones

Morbus coxae senilis is an example of primary osteo-arthritis restricted abduction and rotation are early signs but flexion remains unimpaired even in advanced cases Pain may be referred not to the hip but to the corresponding knee

Heberden's nodes are sometimes attributed to osteo-arthritis They are often associated with this disease but they commence as a fibrositis followed by bony formation There is often a history of trauma strain arthritis or gout

The *prognosis* in osteo-arthritis is governed by three factors

(1) The cause of the condition —The correction of flat-foot in osteo-arthritis of the knees may be fully successful Gouty cases even with thinning of the cartilages often yield to spa treatment Following mild or cured arthritis the condition may become stationary but when associated with arteriosclerosis the disease tends to progress

(2) The joint affected —Morbus coxae senilis has a bad prospect though temporary relief is possible fixation of the joint provided a good position is secured is sometimes the best result obtainable

(3) The state of the cartilages —If parts of these have disappeared orthopaedic measures are required With merely localized thinning correct splinting and local treatment may mean at least partial recovery

There seems little doubt that certain forms of arthritis in animals constitute a true osteo-arthritis The most typical example cab-horse disease (suffraginitis) is characterized by the formation of a large exostosis of the inner side of the pastern bone of the fore-leg together with disease of the articular cartilage on the inner side of the joint

This condition appears to be due to strain and repeated minor injury such as concussion on hard roads or strain of ligaments produced by jumping or by starting heavy loads

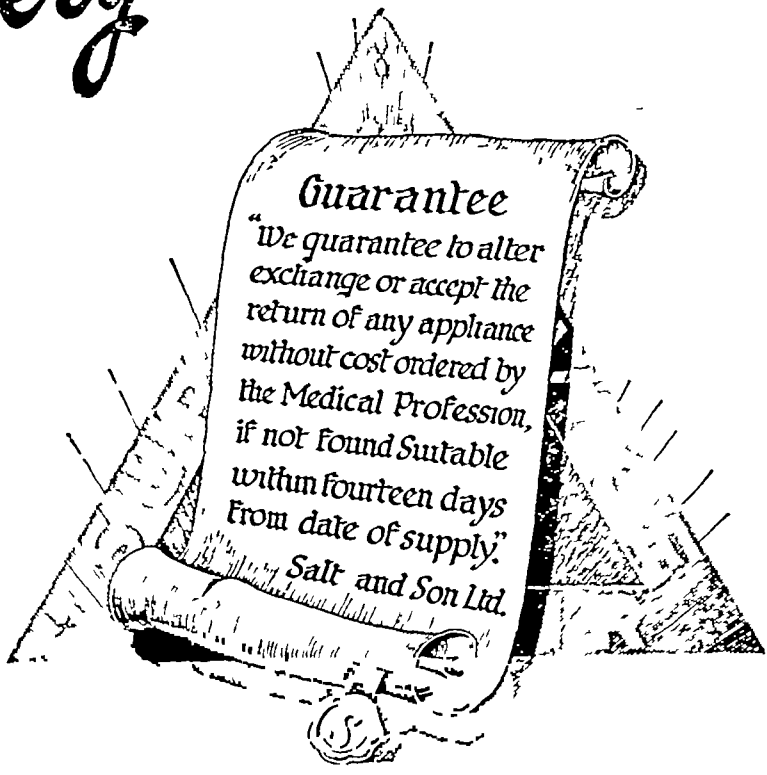
The position of the lesions is constant and is that of the greatest strain the affected bones absorbing most of the concussion before it reaches the larger bones

The hereditary transmission of an upright short pack seems to be a factor in the production of exostoses but even apart from this there would appear to be some constitutional liability to throw out bone in answer to the slightest stimulus

SURGICAL SERVICE SALTAIR

SALTAIR SURGICAL SERVICE

The Guarantee behind every Salt appliance.



CAN BE TAKEN LITERALLY AS IT REALLY MEANS WHAT IT STATES

Sometimes a Medical man thinking that a patient might benefit by wearing a certain appliance, is hesitant about ordering it, lest the patient may ultimately refuse to accept it with a consequent loss to the doctor

THE SALT GUARANTEE REMOVES THIS FEAR.

Even a special experimental appliance will be made and its return accepted within the stipulated period without any charge being made. Naturally since the inception of this Guarantee we have had instances where we have failed to satisfy a fastidious patient. In these cases we have carried out the terms of our Guarantee in full and have been surprised to receive expressions of appreciation of our action evidently denoting some doubt existed as to the genuineness of our statement. That is our reason for displaying the Guarantee thus prominently

SALT AND SON LTD.
7, CHERRY ST., BIRMINGHAM.

others on the nerve trunk as it descends through the pelvis Examples are (1) sacro-iliac and lumbo sacral strain, (2) disease, as meningitis (syphilitic or other variety), or tumour within the spinal canal, (3) vertebral disease—for example, malignant growths, injury, scoliosis or other deformity, arthritis, (4) intrapelvic disease causing pressure on or involving the nerve trunk

When central or intrapelvic disease is responsible a bilateral "sciatica" is obviously possible, and therefore such a distribution necessarily arouses suspicion, sometimes sciatic pain in both lower limbs is associated with glycosuria But whether bilateral or unilateral a diagnosis of "simple" sciatica can never be justified until all the above possibilities have been excluded The absence of tenderness in the course of the nerve suggests that the condition is due to a cause other than perineuritis

In connexion with the differential diagnosis may be mentioned

(1) The "lightning" pains of tabes dorsalis, to be recognized by other evidences of the disease

(2) Disease of the hip joint with pain referred to the corresponding knee, to be excluded by radiological and other examinations

(3) Disease of the sacro-iliac joint
(4) Fibrositis of the hamstring muscles

} No tenderness of the nerve trunk or its branches, no increase of pain on dorsiflexion of the foot when the thigh is flexed to the point at which the position causes pain

(5) Sciatic neuralgia—that is, sciatic pain without central cause or local fibrositis nerve not tender, Achilles jerk not lost, and pains in peripheral distribution of the nerve rather than in the nerve trunk

(6) Sciatic parenchymatous neuritis The nerve fibres being affected, there are, in addition to pain and tenderness, anaesthesia and trophic disturbances The absence of the Achilles jerk indicates some implication of the nerve fibres

Treatment of Sciatica When the symptoms are acute rest in bed is essential The limb may be supported by sandbags or even fixed by a long splint, warmth, radiant heat, poultices or packs are helpful Aspirin in full doses may relieve pain, morphine, if possible, should be avoided Blisters, acupuncture and the injection of normal saline or of oxygen into the nerve sheath are useful If there is a history of gout or rheumatism appropriate remedies should be prescribed When acute pain has been checked massage and electricity and treatment at an appropriate spa are indicated

III INCIDENCE

The forms of disease discussed in this report are very common, but no accurate statistical record of their prevalence is available Some appreciation of the position can be gathered from statistics of the National Health Insurance Service recorded by Dr Alison Glover These and other estimates indicate that the loss of work time due to rheumatic diseases (of all types) is 5,500,000 days in a single year, or for arthritic diseases alone, 4,500,000

The cost involved under the National Health Insurance Scheme in the shape of administrative expenses and disbursements to insured persons suffering from rheumatic diseases (of all types) in one year is in excess of £5 000 000 and for arthritic and allied conditions £4 500 000, further the large amount of rheumatism amongst uninsured persons adds considerably to the above figures

IV AETIOLOGY

Sex Women are the more frequent sufferers from primary rheumatoid arthritis, chronic villous arthritis and panniculitis, men from secondary rheumatoid arthritis and spondylitis The incidence of osteo arthritis and of fibrositis (other than panniculitis) is approximately equal in the two sexes

Age The victims of primary rheumatoid arthritis are often women of child bearing age, of chronic villous arthritis, women in middle life, and of spondylitis ankylopoietica, men from 20 to 40 years Both osteo-arthritis and spondylitis osteo arthritica occur particularly in late middle life and old age

Climate Damp is undoubtedly a factor in the production of rheumatoid arthritis and fibrositis, especially when combined with cold or with marked alternations of temperature Osteo arthritis, on the other hand is rife and has long been so, in the hot, dry climate of Egypt

Occupation Miners are prone to fibrositis Statements that metal workers and railway men are especially liable to arthritic disease have at present no secure foundation These terms cover various groups of workers who work under conditions which differ widely in relation to strain and exposure and risk of injury A careful analysis recognizing these differences must precede any attempt at generalization Primary rheumatoid arthritis is specially liable to affect women in indoor occupations

Endocrine imbalance between thyroid, pituitary, adrenal ovarian, and corpus luteum secretions is very frequent Hyperthyroidism is especially associated with primary rheumatoid arthritis, and hypothyroidism with chronic villous arthritis

Allergic sensitivity is probably an important causative factor, but this is incapable of precise measurement

Infection associated with septic foci admittedly plays an important part in the causation of the disease conditions here under review Streptococci especially of the *viridans* type, less often of the haemolytic type or of other strains, are the commonest infections, but staphylococci or a bacillus of the coliform group may sometimes be concerned

In summary, the important aetiological factors are (1) In primary rheumatoid arthritis, unknown, in secondary, infection (2) In chronic villous arthritis evidence of infection is inconclusive, thyroid deficiency with strain on the affected joint due to excessive bodily weight is important (3) In osteo arthritis infection makes some contribution in secondary cases, but in the primary form strain and arterial degeneration (local and general) are often provocative agencies (4) In spondylitis ankylopoietica infection is the predominant cause (5) Spondylitis osteo arthritica (see osteo arthritis) (6) In fibrositis many cases are due to infection but perhaps with equal frequency the cause is metabolic disorder and defective elimination

The following areas demand careful examination

Teeth Both clinical and radiological examination is necessary, apical infection is especially important capped and dead teeth are always to be suspected

Tonsils Tonsillar infections are frequent Arthritis due to these occurs particularly in young persons pyrexial periods are common, and in some cases these are associated with effusion into the joints Unlike subacute rheumatism these cases are not relieved by salicylates and do not develop carditis

Nasal Sinuses Of these the maxillary antrum is the commonest site of infection Radiograms and transillumination should of course be utilized but they are sometimes misleading The only certain test in doubtful cases

is by antral puncture and bacteriological examination of the antral washings

Pharynx There may be a general infection of the mucous membranes of the pharynx and nose altogether apart from any local infection in the tonsils or nasal sinuses

Intestines Infection generally streptococcal without signs of active colitis Chronic appendicitis cholecystitis and diverticulitis may also be responsible

Urogenital Tract The urethra prostate vesiculae seminales and pelves of the kidneys are possible sites of infection bacteriological examination of the urine perhaps after massage of the prostate is of course necessary In women gonorrhoea is a cause of arthritis not infrequently overlooked cervical erosions not necessarily gonococcal and latent salpingitis must be remembered

Infective Origin of Arthritis

Some recent work has been brought forward to support the view of the infective origin of arthritis and allied conditions More especially American observers have claimed positive cultures of streptococci from large quantities of blood incubated for long periods of time These experiments cannot yet be regarded so proof against refutation as to be accepted without reserve It is highly desirable therefore that this cultural work should be repeated with a view to confirmation or otherwise Obvious fallacies arising from the late appearance of streptococci in cultures of material from the human body should be excluded so far as possible by control observations

Similarly when searching for the presence of specific antibodies to streptococci in the blood of patients it is desirable that more than a single method should be employed As suspensions of streptococci may vary in agglutinability from time to time results obtained by agglutination should be checked by examining for the presence of complement fixing or other antibodies as well and here again control observations are essential in order to exclude error

Work on the streptococci (which are regarded as the main bacterial contributors towards rheumatism) cannot at present be carried out with certainty A selection can be made but it is impossible for example to select a particular pathogenic streptococcus in any case with the certainty with which we can identify tubercle or typhoid bacilli and this has led to a multiplicity of incompatible results concerning streptococci all over the world

This work is an important aspect of future research on arthritis (see p 1052)

V MORBID ANATOMY

In considering the morbid anatomy of the several arthritic conditions lack of uniformity in the existing schemes of classification constitutes a difficulty For example the Committee was so fortunate as to obtain a valuable analysis of the Strangeways Collection admittedly the most complete collection of specimens of joint disease in this or perhaps any other country yet to correlate the conditions displayed in this collection to the other aspects of the Committee's work proved impossible because the classification there employed is more elaborate than that in common use

[*Note* The material of the Strangeways Collection is exhaustively analysed in Mr Lawford Knaggs's articles in the *British Journal of Surgery* July (p 113) and October (p 309) 1932 and January (p 425) 1933.]

Primary and secondary rheumatoid arthritis do not present any significant differences in morbid anatomy one from the other The following description therefore applies to both

The disease begins with a round-celled infiltration of the synovial membrane most marked at the margins in the neighbourhood of the circulus articuli vasculosus Proliferation in the synovial membrane takes place with the formation of granulation tissue which extends as a pannus over the joint surface of the cartilage Simultaneously proliferation takes place in the connective tissue of the bone in a subchondral area with the formation of granulation tissue on the bone side of the cartilage Between these two layers the cartilage gradually becomes destroyed and replaced by granulation tissue fibrous tissue is formed with resulting partial or complete ankylosis of the joint In the marginal areas osteoid tissue may be formed by proliferation of the connective tissue and the resulting ankylosis may be cartilaginous or partly bony

In the early stages the synovial fluid is increased in the later stages with diminution or disappearance of the joint cavity it becomes lessened in amount or completely absent The capsule of the joint becomes infiltrated by lymphoid cells new blood vessels appear and fibrous tissue is laid down with resulting thickening of the periarticular tissues The lime salts of the bone become absorbed leading to rarefaction and loss of density according to Allison and Ghormley local collections of lymphocytes in the synovial membrane subchondral connective tissue and the capsule is a characteristic feature of rheumatoid arthritis distinguishing it histologically from other forms of joint disease

This process may be contrasted with that in pyogenic arthritis in which the infiltration is by polymorph leucocytes and the destruction of cartilage is due to a chemical process of leucocytic origin On the other hand in rheumatoid arthritis the infiltration is by lymphocytes which do not produce a destructive enzyme the destruction of cartilage is due to invasion by granulation tissue

Again in osteo arthritis the changes begin in the cartilage and appear secondarily in the synovial membrane while other changes are the formation of osteophytes destruction of cartilage eburnation of bone and fixation of the joint but this never proceeds to true bony ankylosis

CHRONIC VILLOUS ARTHRITIS

The synovial membrane in such cases as have been examined is found to be thickened and congested with an increase in the number and size of the fringes (hence the name villous arthritis) Microscopically there is an increase of blood vessels and small-celled infiltration of the tissues In certain cases these changes lead on to typical osteo-arthritis

OSTEO-ARTHRITIS

The earliest histological changes are doubtful but degenerative changes in the articular ends of the bones have been demonstrated in skiagrams as very early manifestations Eventually osteo-arthritis is characterized by degenerative changes in the articular cartilage the synovial membrane the ligaments and the articular ends of the bones The most distinctive feature of the disease is the formation of osteophytes These compensate for weakened ligaments and enlarge the surface over which weight carried by the joint can be distributed (For a detailed description of osteo-arthritic changes see Mr Lawford Knaggs's paper see p 1039 col 1)

SPONDYLITIS

In the ankylopoietic type the ossification of the ligaments is characteristic and osteo-porosis a very marked feature The morbid anatomy of the osteo-arthritic type corresponds in every respect to that of osteo-arthritis in other parts of the body

FIBROSITIS

The fibrositic nodule is formed by a blocking of the lymphatics followed by a localized leucocytic infiltration and this in turn by fibrosis and scar formation There is no record of a recovery of micro-organisms from fibrositic nodules

CHINOSOL

BRAND *Oxy-Quinolin Potassium-Sulphate*
In Powder and Tablets.

FREE SAMPLE and literature to Medical Practitioners.

Antiseptic. Non-Corrosive. No injurious effect on healthy tissue cells A powerful deodorant of special value for cleansing suppurative and malodorous wounds
Tablets disintegrate in 30 seconds and dissolve to a clear solution.

VI BIOCHEMISTRY

BLOOD

Sedimentation Rate (Suspension Stability) This test depends on the rate at which red blood corpuscles sink under the influence of gravity when oxalated blood is drawn off into glass tubes In all infective conditions there is a tendency for sedimentation to be more rapid than the normal rate

In one method of estimating the sedimentation rate the tubes are graduated into 100 units In freshly drawn blood the red corpuscles are in complete suspension and therefore extend to the 100 mark , later, sedimentation takes place, so that the level of the fluid showing suspension of red cells falls to a lower mark In normal blood the sedimentation does not cause the level of the fluid containing suspended red corpuscles to fall below 80 in one and a half hours In blood from cases of active infection the fluid may fall to the 50 mark in half an hour

Rheumatoid Arthritis This subgroup has the highest sedimentation rate of all forms of chronic arthritis and in many cases the readings approach the possible minimum in thirty minutes , also the percentage of cases showing an improvement after treatment is the lowest of all the types under consideration

The results are often at variance with the subjective and objective clinical findings , these may show a definite improvement although the sedimentation rate is practically unaltered This may be explained either by assuming that the sedimentation rate results lag behind the clinical symptoms or that the clinical improvement is merely a local amelioration leaving the basic condition practically unaltered—a hypothesis supported by clinical experience as to the general intractability of this type to treatment so far as complete recovery is concerned

Chronic Villous Arthritis The cases of chronic villous arthritis examined have given a curve resembling that of rheumatoid arthritis and since metabolic disorders *per se* have but little influence on the sedimentation rate it is possible that the changes found in this type are due to an infective arthritis associated with endocrine deficiency

Osteo arthritis, including Morbus Coxae Senilis Two well marked groups may be differentiated , one of these has a normal or almost normal sedimentation rate and is possibly traumatic or static in origin, and the other possibly of infective origin has a definitely lowered sedimentation rate The former a more numerous group is usually monarticular the latter polyarticular

Spondylitis Spondylitis ankylopoietica and spondylitis osteo arthritica resemble respectively rheumatoid arthritis and osteo arthritis in their sedimentation rate values

Fibrositis (Muscular) The results obtained with this subgroup are variable

Lumbago and Fibrositis In these cases the sedimentation rate is usually either normal or but slightly subnormal In sciatica when the nerve trunk only is involved the results are almost invariably normal but when the nerve root is affected with neurotrophic disturbances the sedimentation rate is increased the level may reach the 50 mark in one hour and at the same time muscular wasting is pronounced

Concurrent Disease When blood samples are taken for the determination of the sedimentation rate it is essential that the presence or absence of a concurrent infection such as a common cold should be noted as such a condition may increase the sedimentation rate to a material extent This particularly applies to determinations made during treatment as the effect of the cold may mask temporarily any improvement due to treatment It is desirable also that determination should not be made for several days after injections of vaccines etc particularly if any reaction has thus been produced A concurrent metabolic disease such as diabetes does not affect the result

pH The hydrogen ion concentration of the blood serum or plasma in rheumatic diseases has not received much attention but the evidence available suggests that there are no material abnormalities

[*Note* The limits usually accepted as normal are 7 35 to 7 45, but it must be remembered that the mode of expression is logarithmic and not arithmetrical so that a change of *p*H from 7 45 to 7 35 represents an increase of no less than 25 per cent in the hydrogen ion concentration]

Uric Acid The different methods in use for testing the amount of uric acid present in normal blood give conflicting results but it may be assumed that the normal content is from 3 5 to 4 mg per 100 c cm in males and about 0 5 mg per 100 c cm less in females The proportion is increased in gout but there is no evidence that it is increased in other arthritic conditions provided these are free from complications

Urea and Renal Functions There is no conclusive evidence either of a retention of urea or of albuminuria or indeed of any disturbance of the renal function that can be attributed to arthritic disease

Liver Function Some results suggesting a disturbance of liver function have been obtained in infective arthritis but these await confirmation

CO_2 Content and Alkaline Reserve These terms are not synonymous The alkaline reserve, expressed as combining power to CO_2, is usually two volumes per cent higher than the total CO_2 content The total CO_2 content of the blood plasma in 149 cases of various rheumatic diseases was found to be normal except in cases of rheumatoid arthritis which gave rather low values the average being 6 to 7 volumes per cent below that of healthy subjects This conclusion has since been confirmed It should be noted, however that in spondylitis the two types give different results, the CO_2 in the osteo arthritica type being normal whilst it is subnormal in the ankylopoietica type, which thus in this respect resembles rheumatoid arthritis The deficiency in the CO_2 content might be regarded as evidence of a tendency towards acidosis but it is equally probable that it is due to an asthenic condition of the tissues which results in the venous blood containing more oxygen and less CO_2 than are present in healthy subjects

Glucose Largely owing to the work of Pemberton of Philadelphia and his associates, work confirmed later by experimenters in other countries, it is now recognized that a majority of cases of rheumatoid arthritis exhibit a definite "glucose intolerance"—that is on the administration of glucose the blood glucose increases more or less normally during the first 30 to 45 minutes, and then decreases at an abnormally slow rate thus producing a characteristic "lag" type of curve Glycosuria rarely occurs The Philadelphia workers found also that if a definite focus of infection could be discovered and removed the arthritis cleared up and the glucose tolerance returned slowly to normal The occurrence of the phenomenon of glucose intolerance in many arthritics is indubitable but its significance appears to have been misinterpreted by some clinicians Pemberton's suggestion that a low carbohydrate diet is indicated may have led to the assumption that there is a disturbance of the carbohydrate metabolism but all his results as he himself emphasized, indicate that the defect is in the tissues and their blood supply and not in the pancreas , and that owing to a vaso constriction the tissues absorb and store glucose at a reduced rate Such a vaso constriction would accord with the findings of Pemberton and others that the venous blood of arthritics often shows a relatively high saturation with oxygen and a low CO_2 content that vaso dilators reduce the intolerance that the first drop of blood from a finger prick shows an abnormal variation from later ones as regards the red cell count that the venous and arterial bloods show abnormal variations during the glucose test and that the constriction in superficial capillaries can be demonstrated by microscopical examination

It may be noted also that the excretion of acetone bodies in the urine of forty six rheumatic cases has been estimated without finding evidence of a disturbed carbohydrate metabolism

Calcium Some workers have reported an increased amount of calcium in the serum of arthritic and gouty patients but the general consensus of opinion is that there is no satisfactory evidence of hypercalcæmia The serum Ca is found to be almost invariably subnormal in the ankylopoietica type of spondylitis and rather variable in the osteo arthritica type

Magnesium No data are available in the literature as to the magnesium content of the serum in the diseases here under consideration but the results with forty five samples recently examined indicate that it is remarkably constant at about 2 2 mg per 10 c cm a value that is quite normal

Inorganic Phosphorus With the possible exception of spondylitis ankylopoietica in which the results tend to be low though not outside the usually accepted limits of normality the inorganic phosphorus content is normal in all rheumatic diseases and gout

Proteins The total protein is usually normal in amount except in rheumatoid arthritis and spondylitis ankylopoietica in which it is often 1 to 1 5 per cent. higher Changes in the absolute amounts of albumin and globulin are common and show some correlation with the sedimentation rate In rheumatoid arthritis the low sedimentation rate is associated with a reduction in the albumin/globulin ratio and an increase in the fibrinogen

Cholesterol No significant changes in the cholesterol content of the blood have been reported

Phosphatase Phosphatase an enzyme capable of hydrolysing phosphoric esters and probably associated with ossification can be demonstrated in small amounts in normal blood In some bone diseases the phosphatase content of the blood is increased but in arthritis it is normal except in spondylitis ankylopoietica in which slightly higher values have been found The increase appears to be related to the ligamentous ossification which is a marked feature of this disease

Blood Groups This subject has been investigated and found to be without significance

URINE

Acidity Reaction and Phosphates The hypothesis that different types of rheumatic disease can be divided into two groups one with an acid and the other with an alkaline diathesis has long been popular and is often being revived in one form or another It has been reported that rheumatoid arthritis and osteo-arthritis have an alkaline and acid diathesis respectively the former being characterized by deficient acid elimination and the latter by deficient alkali assimilation The results of more recent and carefully controlled experiments gave no evidence either of an acid or an alkaline diathesis in the two types of disease here mentioned

Uric Acid In rheumatic diseases the amount of uric acid in the urine is normal In gout it becomes subnormal immediately preceding an attack increases sharply with the onset of clinical symptoms and then falls slowly to the normal level

Calcium and Magnesium The published work regarding the urinary excretion of calcium in arthritis is scanty and does not suggest abnormality

Cystine The few cases investigated at the Devonshire Hospital gave no evidence of abnormalities in the excretion of cystine though it has been claimed that the cystine content of the nails is more variable than normal

Creatinine The creatinine coefficient (urinary creatinine in milligrams divided by body weight in kilos) has been found to be approximately normal In the more advanced cases of rheumatoid arthritis in females a number of rather low readings have been obtained a result which can be attributed to the myasthenia so frequently found in this type

Indican Intestinal stasis with excessive absorption of toxic products of bacterial metabolism has been suggested as a possible factor in some cases of arthritis but if indicanuria can be regarded as a criterion of this absorption the available evidence does not support this hypothesis

Sulphur A recent writer has suggested that arthritics exhibit an abnormal sulphur metabolism evidence of which can be obtained by an analysis of the urine also that there is a deficiency of thiopexy (increased katabolism of sulphur) in rheumatoid arthritis but other workers have failed to confirm this

SWEAT

During the latter half of the last century the hypothesis that arthritis was caused by an excessive accumulation of lactic acid in the body was accepted by some workers although the evidence in support of it was rather meagre Recent workers using more exact methods found that the lactic acid in the blood urine and sweat of arthritic subjects showed no material variation from that in non arthritics and concluded that their findings lend no support to the idea that arthritis at least in the types studied is caused or characterized by abnormal production or disposal of lactic acid

The skin reaction of arthritics is generally acid and this coupled with the fact that the reaction of the sweat became more alkaline during heat treatment led some observers to assume that the arthritis was associated with a relatively acid condition of the blood which could temporarily at least be ameliorated by such treatment Physiologists have however demonstrated that the reaction of the secretion of the sweat glands is always alkaline and that the acidity of the skin is due to decomposed sebaceous matter

An acid reaction of the skin is found in non arthritics as well as in arthritics and it has been emphasized that the change in reaction during a hot air or vapour bath is a normal physiological process Owing to the pyrexia induced by the bath respiratory activity increases and results in an excessive loss of carbonic acid from the blood this produces a temporary phase of increased *p*H during which the sweat becomes less acid Later it returns to its normal *p*H

GASTRIC JUICE

The acidity of the gastric secretion in arthritics has received very considerable attention from many investigators One aspect of its importance is based upon the hypothesis that the free HCl acts as a germicidal barrier to the passage of organisms from the buccal and nasal cavities to the intestinal canal Although a few workers have found a very abnormal incidence (up to 70 per cent.) of achlorhydria a less abnormal figure (20 to 30 per cent.) was obtained by others After a complete and thorough examination of this and related problems it has been concluded that the incidence of achlorhydria or hypochlorhydria in arthritics is five times higher than in normal subjects but only slightly higher than in certain other diseases and the difference is too small to warrant any definite conclusion being made as to its aetiological significance The importance of HCl obviously depends upon whether it is the sole line of defence and it has been suggested that there is a germicidal factor in the gastric juice independent of the HCl and a similar one in the duodenum No evidence of a second germicidal factor in the gastric juice has been obtained

VII RADIOLOGY

The diagnostic features are

(*a*) *Osteoporosis* an increased transparency of bone seen as a local change in infective conditions such as tuberculous caries and osteomyelitis in some conditions a widespread loss of bone calcium occurs (general osteoporosis)

(*b*) *Osteosclerosis* an increase in the normal bone density follows the resolution of an inflammatory process

(*c*) *Bone Density Balance* Normally there is a definite relation between the density of the cortex medulla and cancellous ends of the bone the density of the cortex being three times that of the cancellous bone This balance can remain unaltered even in advanced general osteoporosis The significance of a disturbance of this balance is uncertain It is frequently present as a senile manifestation

RADIOGRAPHIC CHANGES

Rheumatoid Arthritis (Primary and Secondary)

During the active stage generalized osteoporosis occurs suggestive of disturbance of metabolism Some cases usually of secondary rheumatoid arthritis show this osteoporosis accentuated around the minor joints This may be followed by destruction of cartilage and articular bone

THE RESIDENTIAL TREATMENT OF ALCOHOLISM & DRUG ADDICTION

RENDLESHAM HALL

(Postal Address)—WOODBRIDGE, SUFFOLK

Rendlesham Hall which is open to receive patients is essentially a Sanatorium Its daily life and routine are that of an ordinary comfortable holiday or health resort or of a large country house. Each patient has all the privileges of a guest consistent with the prescribed medical treatment.

Rendlesham Hall has 45 bedrooms and about 450 acres of gardens and park It has also a private nine hole golf course, tennis and croquet lawns and bowling green

President THE MOST HON THE MARQUESS OF EXETER C M G A D C.

Medical Superintendent DANIEL F RAMBAUT M A , M D

This registered Hospital is situated in 120 acres of park and pleasure grounds Voluntary patients who are suffering from incipient mental disorders or who wish to prevent recurrent attacks of mental trouble temporary patients and certified patients of both sexes, are received for treatment Careful clinical biochemical bacteriological and pathological examinations Private rooms with special nurses, male or female in the Hospital or in one of the numerous villas in the grounds of the various branches can be provided

WANTAGE HOUSE

This is a Reception Hospital in detached grounds with a separate entrance, to which patients can be admitted It is equipped with all the apparatus for the most modern treatment of Mental and Nervous Disorders It contains special departments for hydrotherapy by various methods including Turkish and Russian baths the prolonged immersion bath, Vichy Douche Scotch Douche Electrical bath *Plombieres treatment*, etc There is an Operating Theatre a Dental Surgery an X ray room an Ultra violet Apparatus and a Department for Diathermy and High Frequency treatment It also contains Laboratories for biochemical, bacteriological, and pathological research.

MOULTON PARK.

Two miles from the Main Hospital there are several branch establishments and villas situated in a park and farm of 650 acres Milk meat fruit, and vegetables are supplied to the Hospital from the farm gardens and orchards of *Moulton Park Occupation therapy* is a feature of this branch and patients are given every facility for occupying themselves in farming gardening and fruit growing

BRYN-Y-NEUADD HALL.

The seaside house of St Andrew s Hospital is beautifully situated in a Park of 330 acres Llanfairfechan, amidst the finest scenery in North Wales On the North West side of the Estate a mile of sea coast forms the boundary Patients may visit this branch for a short seaside change or for longer periods. The Hospital has its own private bathing house on the seashore There is trout fishing in the park

At all the branches of the Hospital there are cricket grounds football and hockey grounds lawn tennis courts (grass and hard courts) croquet grounds golf courses and bowling greens Ladies and gentlemen have their own gardens and facilities are provided for handicrafts, such as carpentry etc

For terms and further particulars apply to the Medical Superintendent (Telephone No 2356 and 2357 Northampton) who can be seen in London by appointment

HAYDOCK LODGE,

NEWTON-LE-WILLOWS, LANCASHIRE.

and subluxation and ankylosis represent the final stages During the quiescent period recalcification has been described

Osteo-arthritis

(*a*) *In the Hand* This condition is characterized by loss of cartilage, followed by irregularity and obliteration of the joint spaces and by the formation of osteophytes

(*b*) *In the Hip* Although the majority of arthritic hips are clinically diagnosed as osteo-arthritis, a condition considered to be of degenerative origin, the remarkable variety of changes seen in the joint radiographically, changes which are often quite opposite in character, suggests that this group includes not one, but several distinct forms of arthritis Further work is necessary to determine the distinguishing radiological features of each

The chief radiographic changes seen in an osteo-arthritic hip may be summed up as follows (1) loss of cartilage, especially at the maximum pressure point , (2) new bone laid down either as " fringe " osteophytes or as new bone deposits in the acetabulum (this latter condition tends to displace the head of the bone outwards and upwards) , (3) cavitation of the acetabulum or femur frequent, either small multiple or several large cavities found , (4) local osteoporosis or osteosclerosis

Much depends on where the disease first attacks the joint In one group new bone becomes thrown out at the junction of the femoral head and neck, the angle of the neck is often increased, and the limb becomes shortened In a second group considerable shortening of the neck takes place with a mushroom-like appearance of the head of the bone, but this is not forced out of the acetabulum because of the ligamentum teres thus differing from tuberculosis, where absorption of the ligament takes place In a third group the disease is mainly in the floor of the acetabulum and evidence of this is seen in a corresponding prominence on the inner aspect of the pelvic wall (Otto's disease)

Spondylitis

(*a*) *Spondylitis Ankylopoietica* The earliest radiographic signs are osteoporosis of the vertebral bodies and changes in the cartilages of the sacro iliac joints and in those of the spinal articular processes Ossification of the margins of the intervertebral disks, leading to fusion of the bones of the spine into a solid mass, follows The distinctive feature is the early ossification of the ligaments and disks —a condition not met with in any other form of arthritis The softening of the vertebral bodies leads to their compression, and a bamboo like appearance often results

(*b*) *Spondylitis Osteo arthritica* This shows radiographic changes similar to those seen in osteo arthritis of the hip Osteophytes form on the bodies of the vertebrae and by uniting may produce fixation of the spine

Gout

Gout is mentioned here because it is frequently mistaken clinically for other forms of arthritis Radiographically gout may be indicated by the presence in the articular ends of bones of deposits of biurate of sodium, giving rise to clear punched-out ' areas All cases however do not necessarily show these deposits, nor do ' punched out ' areas necessarily indicate gout

It has been claimed that it is possible to distinguish in the hand the radiographic changes that characterize rheumatoid arthritis, osteo arthritis, and gout respectively At present the radiographic diagnosis presented in this fashion does not always coincide with the clinical diagnosis This discrepancy may eventually be rectified

[*Note* —Radiology may be expected to supply an increasingly useful and direct means of differential diagnosis in cases of chronic arthritis especially as the more accurate methods now being employed enable the minute changes which characterize the early stages of the disease to be recognized and recorded]

VIII DIFFERENTIAL DIAGNOSIS

In discussing differential diagnosis it is necessary (1) to isolate from one another the varieties of arthritic and allied conditions dealt with in the present report , (2) to separate from other forms of arthritis the forms of arthritis here considered , and (3) to distinguish the pain and limitation of movement due to arthritis or fibrositis from similar symptoms produced by conditions other than these diseases

THE DIFFERENTIATION FROM ONE ANOTHER OF THE SEVERAL FORMS OF ARTHRITIS AND ALLIED CONDITIONS DEALT WITH IN THIS REPORT

(A)

—	Primary Rheumatoid Arthritis	Secondary Rheumatoid Arthritis	Chronic Villous Arthritis	Osteo-arthritis
Incidence	Women of child bearing age	Any age either sex	Women at menopause	Both sexes in later decades of life
Onset	Generally subacute	Sometimes acute	Slow and chronic	Slow and chronic
Infection	Not proven	Septic focus	Not proven	Present only in secondary form
Prodromal symptoms	Present	Absent	Absent	Absent
General condition of patient	Ill and emaciated	Affected in later stages only	Florid and healthy	Tending to show signs of senile changes
Joints affected	Small joints tendency to spread centripetally	Any joint distribution tendency to symmetry	Predominantly knees also 1st carpo-metacarpal joints	Large joints especially hip
Appearance of joints	Fusiform swelling accentuated by wasting of surrounding tissues	Fusiform swelling accentuated by wasting of surrounding tissues	Pouched swelling of knees	May be swollen more or less symmetrically in large joints smaller joints tend to be in later
Movement	Much restricted	Much restricted	Not much restricted	May be very restricted in one directions but free in others
Crepitus	Coarse creaking or absent	Coarse creaking or absent	Fine crepitation	Coarse grating
Muscular wasting	Marked	Variable	Absent	Marked in late stages only
Skin	Trophic changes	Trophic changes sweating often marked	Myxoedematous	Senile changes
Pain	May be severe	May be severe	Aching not severe	May be very severe
Thyroid ..	Hyperthyroidism common	No constant change	Hypothyroidism	Tending to hypothyroidism
Pulse ..	Rate increased	Rate varies with severity	Not affected	Arteriosclerotic
X ray	Marked general osteoporosis	Similar but osteoporosis is often confined to the ends of the bones	No change till late stages when osteophytic formation	Areas of degeneration and osteophytes
Removal of septic focus	No improvement	Often improvement	No constant improvement	No constant improvement

RUTHIN CASTLE, NORTH WALES

REDUCTION OF FEES

In view of the present economic position the inclusive fees at *Ruthin Castle* formerly from 17 guineas a week have been reduced to from 15 guineas a week

The fees include medical attendance all scientific investigations that may be needed such as analyses bacteriological cultures the ordinary x ray examinations and electrocardiograph readings all treatment that may be prescribed such as special diets insulin artificial sunlight electrical treatment baths massage nursing medicines or vaccines board and lodging

The only extra charge is that for a complete alimentary x ray examination or for x ray therapy

All the usual forms of treatment are given at Ruthin Castle The climate is mild The annual rainfall is 30 5 inches that is less than the average for England There is central heating throughout Should the accommodation in the Castle not prove sufficient comfortable rooms can be obtained near by for those undergoing treatment

Address—THE SECRETARY Ruthin Castle North Wales Telegrams CASTLE, RUTHIN Telephone RUTHIN 66

(B)

	Spondylitis Ankylopoietica	Spondylitis Osteo-arthritica
Onset	Gradual sometimes rapid	Slow generally sometimes sudden
Age incidence	20-50	40-70
Sex incidence	Males almost exclusively	Males chiefly
Injury and strain	Not constant and effect indirect	Important
Infection	Important	Not constant and effect indirect
Sedimentation rate	Increased	Normal
X ray	Osteoporosis ossification of ligaments	Degeneration of bone osteophytes
Sacro iliac joints	Early affected	Not necessarily affected
Deformities	Common sometimes severe	Rare seldom severe
Ankylosis	Characteristic extending to ribs sacro-iliac joints and hips	Localized not extending to other joints
Pain	Often severe	Rarely notable except after injury or if nerve roots are pressed on
Stiffness	Progressing to absolute immobility (poker back)	Never very extreme

Diagnosis between Fibrositis and Arthritis

1 *Movements of Joints*.—In arthritis pain and restriction are marked when executing those movements which cause the articular surfaces to move over one another—for example rotation in ball and socket joints. In fibrositis pain and restriction are prominent in those movements which stretch neighbouring structures (capsules tendons bursae muscles). Such painful or restricted movements will vary according to the structure or structures affected.

2 *Tenderness* is found round the margins of the joint in arthritis; in fibrositis it is confined to the structures affected which may of course be adjacent to the joint.

3 *Nodules*.—In primary rheumatoid arthritis nodules when present are superficial. In fibrositis tender nodules and plaques may be felt deeply in the fibrous tissues surrounding the joints.

4 *X ray Examination*.—In arthritis characteristic changes in bone and thinning of cartilage are seen.

5 *Constitutional symptoms* may be prominent in arthritis seldom present in fibrositis.

DIFFERENTIATION FROM OTHER FORMS OF ARTHRITIS

Perhaps the most important differentiation here is between (*a*) rheumatic infection acute and subacute and (*b*) rheumatoid arthritis.

	Acute Rheumatism	Rheumatoid Arthritis
Incidence	Chiefly adolescents and young adults of both sexes	Women of child bearing age (at least in the primary form)
Prodromal symptoms	Tonsillitis common	Often present
Onset	Acute	Subacute (sometimes the two conditions are practically indistinguishable in the early stage)
Joints affected	Flitting from one joint to another complete recovery of individual joints	Small peripheral joints with bilateral symmetry persistence of changes after acute stage has passed
Skin over joints	Red and hot	Shiny cold
Pain and tenderness	Severe very tender	Not severe slight tenderness
Swelling	Due to synovial effusion	Slight periarticular
Pyrexia	May be present and is sometimes high	Not marked occurs initially and or intermittently thereafter
Cardiac involvement	Common may be severe and permanent	Frequent tachycardia but permanent lesions are rare
Spleen and lymph glands	Not enlarged	Not infrequently enlarged
X ray	No change	Local or general osteoporosis
Response to salicylates	Satisfactory	Analgesic effect but only temporary

Still's Disease (see primary rheumatoid arthritis).

Gout.—The arthritic and other symptoms of gout are due to deposits of sodium and calcium biurates. The history of an acute arthritis particularly in the metatarsophalangeal joint of the great toe; tophi either superficial or as punched-out areas in the bones (radiogram) and increase in the blood uric acid are prominent features. Gout should not be diagnosed in the absence of one or more of these signs.

Gonococcal arthritis may affect one or several joints and also the fascia. The diagnosis is completed by the history or evidences of a gonococcal infection.

Arthritis in specific infections such as pneumonia scarlet fever enteric fever and dysentery may be acute and may affect one or many joints. The clinical associations establish the cause of the condition.

Tuberculous arthritis is most common in childhood but occurs also at other ages. The affected joint is swollen and stiff but not acutely inflamed. Skiagrams will show tuberculous disease of the adjacent bones. Fluid from the joint inoculated into a guinea pig may give a positive result.

Pseudo-coxalgia (coxa valga) occurs in young subjects. The evidences are pain and stiffness of the hip a valgus deformity and a distinctive *x* ray appearance.

Charcot's joints occur in tabes dorsalis and syringomyelia. A degenerative arthritis is here associated with atrophic changes and with a loss of sensitiveness this loss means absence of natural protection from damage and consequently considerable disorganization results.

Haemophilic arthropathy due to effusion of blood into the joint (for example the knee) it occurs in males the subjects of haemophilia. Purpura too may be attended by haemorrhage into one or more joints.

Hypertrophic pulmonary osteo-arthropathy is associated with chronic thoracic disease. It causes swelling pain and stiffness of the distal joints of the limbs.

Intermittent hydrarthrosis and other allergic conditions should be differentiated they are intermittent recurrent and transitory.

Syphilitic arthritis is especially liable to occur in congenital syphilis and is characterized by swelling and limitation of movement of the joint but pain is usually inconspicuous.

DIFFERENTIATION OF CERTAIN PAINFUL CONDITIONS

Headache. This is a recognized symptom of many disorders. One of these is fibrositis of the neck and scalp. The symptoms are pain and stiffness after rest aggravated on initial movement but diminishing as the muscles are used; tender spots (nodules) in the neck muscles and scalp and crepitus (which rarely indicates arthritis). Treatment of the fibrositis gives relief and so confirms the diagnosis. Spondylitis ankylopoietica is an occasional cause of headache stiffness or rigidity of the cervical spine tenderness of the vertebrae and radiological examination (p. 1036) distinguish it. Neck pain is frequent in spondylitis osteo-arthritica.

Thoracic pain. Intercostal fibrositis affecting the nerves or muscles may cause very severe pain (pleurodynia) aggravated by respiratory or other movements and tender spots can be detected where cutaneous branches of the nerve emerge. Thoracic pain may be due also to synovitis of the costo-vertebral joints. Pleurisy aneurysm and some forms of cardiac disease are other causes of thoracic pain.

Abdominal Pain. Similarly a fibrositis of the abdominal muscles must be distinguished from other causes of abdominal pain. Further pains distributed to the body wall or limbs may indicate disease of the spinal cord or

meninges or vertebrae Alike in the region of the thorax and the abdomen, unexplained pain may be the precursor of herpes zoster Malignant growths in the vertebrae, either primary or more commonly from metastases, are sometimes responsible for pain, and may for some time show no evidence of their existence other than pain

Pain in the Lower Limbs Intermittent claudication due to ischaemia of the leg muscles consequent on arterial spasm or degeneration has been mistaken for fibrositis The pain appears on walking and may seriously disable the patient In some cases absence or diminution of pulse in the affected limb may be recognized Thrombo angutis obliterans also is distinguished by pain and limitation of walking The lightning pains of tabes dorsalis may be mistaken for sciatica

Diseases of the bones—for example, chronic osteomyelitis—yield pain on pressure over the bone rather than over the joint, and give a characteristic radiological picture Localized abscess in the epiphyseal region of the longer bones may produce no symptoms except pain and perhaps localized oedema, but an *x*-ray examination is conclusive A radiogram will distinguish spondylitis from the kyphosis of the tuberculous spine, and malignant growths in the vertebrae may be similarly recognized Periosteal syphilitic gummata and infective non-suppurative osteo arthritis and periostitis—for example, typhoid spine—are sometimes a source of confusion

Osteitis deformans (Paget's disease) may be responsible for pain and stiffness of the hips The distinctive signs are increased thickness and bowing of the long bones, especially of the femur and tibia, and enlargement of the skull, *x*-rays generally show the cancellous bone thickened

Similarly, osteitis fibrosa, osteomalacia, and diffuse carcinomatosis of bone may cause difficulties in diagnosis These diseases can be distinguished in the early stages only by radiological examination Intracapsular fractures of the hip and other joints, and fracture-dislocations of the vertebrae, must also be differentiated from arthritis by *x*-ray examination

Static Deformities Flat-foot, knock-knee, bow legs, and coxa vara may cause pain and stiffness, the true cause of which may be missed

Disturbed gait in the form of stiffness or disability may be attributed to arthritis when it is really an early symptom of central nervous disease The ataxia of tabes dorsalis and the spasticity of disseminated sclerosis of other pyramidal diseases, and of early Parkinsonism are examples

IX TREATMENT

(*a*) PROPHYLAXIS

Measures for the prevention of arthritis and its allied conditions must obviously be correlated with the multiple factors that may be concerned in the aetiology of these diseases In addition to the 'seed' or exciting agents such as bacteria their toxins and possible allergic reactions attention must be directed to the "soil" and the resistance of the body Hence conditions which impair the general health, such as insanitary environment over fatigue malnutrition and chronic diseases prone to induce metabolic disorders must be taken into account The well being of those engaged in industry the provision of properly ventilated workrooms of dwellings free from damp of bathing facilities of proper food of hours of work organized to avoid undue fatigue and to allow for rest pauses are most important in maintaining the general health and resistance to disease These however are largely sociological problems and, though the medical profession may urge the adoption of such obvious precautions, the execution of them requires communal or co operative action The prevention of epidemic disease, especially influenza, which so often breaks down the resistance to existing factors previously latent, such as focal sepsis, is an ideal to which the health services of the country are fully awake

Among the exciting causes of chronic arthritis and fibrositis infection bulks largely, and some would regard it as responsible for 70 per cent or even more, of the cases As focal infection is by no means always followed by arthritis, it is necessary to allow the influence of some further causal factor before arthritic or fibrositic disturbances can be produced Indeed, in some cases in which a septic focus cannot be found it may, perhaps reasonably, be assumed that metabolic defect, upset of the endocrine balance, or deficiency of the anti infective vitamin A is entirely or mainly responsible for the arthritic or fibrositic phenomena On the other hand, chronic sepsis may produce metabolic and endocrine disorder, and thus a vicious series, including chronic sepsis disturbed metabolism, and endocrine deficiency, may play a part in the causation of arthritic and allied conditions

(*b*) VACCINES

As the precise aetiology of none of the forms of arthritis and allied conditions here under review has yet been determined with certainty, vaccine therapy does not rest on so secure a foundation as it does in conditions where the causative agent is beyond dispute Taken as a whole, however, the evidence now available with regard to the bacteriology of arthritis indicates that organisms of the streptococcal group are in some way concerned in its aetiology, and further evidence in favour of this view is furnished by the beneficial results of vaccine therapy in certain cases

Vaccines should not be given until a case has received the fullest clinical investigation If a focus of infection is found it should be eliminated if possible, but as an exacerbation of symptoms frequently follows such removal it is safer to postpone this step until the acute symptoms have been relieved This improvement can be effected by the administration of a suitable vaccine in small doses over a period of a few weeks

A vaccine, whether "autogenous" or "stock" should be given in doses which are followed by a response but not by a reaction By *response* is meant a definite and speedy improvement in the clinical condition both local and general following an injection, and lasting for two to six days there being possibly at the same time slight constitutional disturbance By *reaction* is meant an increase in pathological manifestations, as shown by depression, malaise, nausea, headache, rise of temperature, and increase of symptoms It is difficult to lay down a precise direction for the small safe initial dose In terms of streptococci 20,000 to 50 000 may be suggested where a septic focus is suspected, and half a million where it is fairly certain that no septic focus exists It is rare for a dose of more than ten millions to be required The practitioner treating arthritis with a vaccine should therefore commence with small tentative doses administered in increasing strength every five or six days and should arrive with as little delay as possible at the optimum effective dose Slight local manifestations at the seat of injection may be disregarded Temperature charts should be kept for a few days before and after during the administration of vaccines

While stock streptococcal vaccines are sometimes inferior to autogenous vaccines, they are superior to imperfectly made autogenous vaccines or to no vaccine Speaking generally, the question of dosage is much more important than the question of the exact form or make of the vaccine, but since dosage is the more difficult problem it is less carefully studied

For particulars apply to the Secretary

According to certain observers the cocci chiefly concerned in the production of arthritis are (1) a form of *Staphylococcus epidermidis* to which the name of *Micrococcus deformans* has been given and (2) streptococci especially *S salivarius* and a form of *S faecalis* the *S zymogenes* The procedure of practitioners who hold this view is to use a stock vaccine made from all the possible streptococci associated with rheumatic disease (157 in all) and two types of staphylococci and to give an injection once a week

Though it cannot be claimed that vaccines will effect improvement in the bony changes in a damaged joint yet in some cases such as old standing osteo arthritis of the hip vaccine treatment is undoubtedly of value in relieving pain and in checking the progress of the arthritis

Vaccine treatment may be combined with other methods of treatment but the possible constitutional effects of such treatment must be recognized and allowed for Therefore in practice difficulty may arise from the blending of several methods of treatment if clinical reactions in the patient are to be the guide for the administration of any one of them

When inoculations are given other forms of treatment should be suspended on the day of inoculation and for two days afterwards

Anti streptococcal serum is not indicated in chronic arthritis

Protein shock therapy such as injection of peptone solution or of typhoid vaccine milk or colloidal sulphur has on the whole been disappointing In some cases definite temporary improvement has occurred but this has often been followed by a relapse

(*c*) DRUGS

While in the treatment of arthritis drugs have no specific value they are of service in the relief of pain and in improving the patient's resistance and general well being

Analgesics sodium salicylate aceto-salicylic acid (aspirin) and the aceto-salicylate of calcium are largely used in the treatment of arthritis and fibrositis they relieve pain but as just stated have no specific action on infective processes

Other pain relieving agents are phenacetin (5 to 10 grains) with caffeine citrate (1 to 2 grains) and amidopyrin (5 to 8 grains) As a rule opium and its derivatives are to be avoided they involve the risk of addiction and check excretory activity codeine (1/6 to 1 3 grain) with aspirin or phenacetin is reasonably safe The barbituric acid compounds (veronal medinal dial allonal veramon luminal) have their values but tend to addiction and to the production of nervous depression

The quinoline derivatives (atophan agotan cinchophen phenoquin atoquinol) are largely used but their administration should be carefully watched They exercise a toxic effect on the liver and have been followed by jaundice After each dose 20 to 30 grains of sodium bicarbonate in water should be taken and after three or four days administration the drug should be suspended for an equal period Their chief use is in gout and the gouty complications of arthritis They should not be prescribed except under medical supervision

Intestinal Antiseptics Guaiacol carbonate (5 to 10 grains) has the advantage that it can be taken over long periods when there is pain aspirin may be added or magnesium carbonate (5 grains) in dyspeptic conditions The old established Chelsea pensioner (guaiacum and sulphur) has its value in chronic cases Other drugs of this order are salol (combined with quinine in nasopharyngeal toxaemia) cyllin dymol beta naphthol and saline purgatives Sour milk or tablets representing the corresponding bacilli or lactose may be used to change the intestinal flora and when there is hypochlorhydria hydrochloric acid with meals is indicated

Iodine Compounds These are widely prescribed Iodine in alcoholic solution added to milk at the time of administration colloidal preparations and lipiodol the potassium or sodium salt are forms of administration frequently prescribed Fibrolysin as a local injection has not proved satisfactory

Gold preparations given by intramuscular injection have been used abroad for the treatment of arthritis but beneficial results have not been confirmed

Tonics including cod liver oil and vitamin-containing preparations have value in chronic arthritis

Local Treatment

For the relief of pain local applications of methyl salicylate with various other drugs are available The syrupy liquid produced by the combination of chloral menthol and camphor applied as a paint and covered with lint and oiled silk is useful Convenient preparations are the A B C liniment and kaolin poultice

In lumbago the following as local injections are valuable 20 c cm sterile glucose solution (10 per cent) quinine urea hydrochloride 5 c cm (1 per cent.) novocain 5 to 10 c cm (1 per cent) In sciatica the injection of sterile normal saline into the nerve sheath combined if desired with 10 per cent novocain has been used with advantage

(*d*) ENDOCRINE PREPARATIONS

In considering the endocrine factor in the causation and treatment of arthritis attention may be confined to the thyroid and the ovaries Any influence that the other endocrine glands may have is to say the least of it problematical

Thyroid Function in Relation to Arthritis

Relaxation of the articular ligaments particularly of the knee heel ankle and thoracic vertebrae causing knock knee painful heel flat foot and lordosis respectively occur in minor degrees of hypothyroidism These conditions which are often painful are due to defective metabolism and to infiltration of ligaments tendons etc with myxoedematous material It is therefore of the greatest importance to look for any stigmata of hypothyroidism The administration of thyroid extract often leads to marked alleviation of such symptoms

Rheumatoid arthritis is frequently complicated by some symptoms of hyperthyroidism Both Graves's disease and arthritis mainly affect females and especially during the early years of child bearing activity

Villous arthritis and some cases of osteo-arthritis are usually associated with definite evidence of endocrine deficiency

The Relation of Ovarian Function to Arthritis

Monarticular osteo-arthritis is apt to occur in women suffering from a fibroid of the uterus The usual explanation is that the fibroid keeps the cervix patent so that infection of the cervical glands and endometrium by organisms of low virulence can occur and that the absorbed toxins from these excite the arthritis In gonococcal arthritis in women also the primary focus of infection is frequently in the cervix The benefit of diathermy to the cervix in this latter condition has been established but this treatment may be quite successful when there is no evident focus of infection in the uterus or elsewhere Because of the apparent relation of the arthritis in some of these cases to the function of menstruation it has been suggested that the ovaries

EXTERNAL EXAMINERSHIPS, 1934

The Senate announce the following vacant Examinerships for the year 1934
For Final and Higher Examinations for Medical Degrees
MEDICINE, SURGERY M D HYGIENE.
For First Examinations for Medical Degrees
CHEMISTRY (TWO) GENERAL BIOLOGY PHYSICS
For Second Examinations for Medical Degrees
ANATOMY CHEMISTRY PHARMACOLOGY
Associate Examiners

Applications will also be invited for Associate Examiners in Medicine, Obstetric Medicine Pathology, and Surgery A separate application form must be used for Associate Examinerships and the word Associate must be *written on it*

Application form (or forms if more than one Examinership is applied for) and particulars of the remuneration and duties can be obtained from the External Registrar

Candidates must send in their names to the External Registrar GEO F GOODCHILD M A B Sc, with any attestation of their qualifications they may think desirable, on or before Monday, July 3rd 1933 (Envelopes should be marked Examinership)

The Senate desire that no application of any kind be made to individual members

If testimonials are submitted one copy only of each is required In no case should original testimonials be submitted If more than one Examinership is applied for, a separate and complete application must be forwarded in respect of each Examinership The appointments will be made by the Senate in November Applicants who desire that the result should be communicated to them are requested to enclose a stamped and addressed envelope with their application

TUITION IN ANATOMY — PERSONAL TUITION during vacation in London or Edin or by correspondence Anatomy (including Histology) suitable for undergraduate or F R C S candidate—Address No 4029 B M A House Tavistock Square W C 1

are at fault Some cases occur in young women when the menstrual function is being established There is a history of irregular menstruation, followed by amenorrhoea and the onset of arthritis Swelling, without excessive pain, develops around the joints, and subluxation occurs in some cases The application of diathermy may be followed by disappearance of pain and swelling, a regaining of full range of movement of the joints, and a return of the monthly periods Other cases are of the climacteric type already referred to , in some, where the climacteric appears abnormally early, the treatment by diathermy is followed by a temporary return of menstruation Arthritis has been successfully treated even when the uterus and tubes have been removed, the ovaries remaining On the other hand, when the ovaries have been removed without the uterus or tubes the arthritis may not respond to treatment by diathermy This suggests that the action of the diathermy is on the ovaries, and that it restores some function dealing with the nutrition of the joints

In view of the admittedly close association between the gonads and the thyroid it is possible that the action of the ovaries, as distinct from that of pelvic sepsis, in arthritis, is an indirect one through the thyroid But the observation that the basal metabolic rate was normal in fifty consecutive cases of chronic arthritis does not indicate that either hypo- or hyper-thyroidism is a very common causative factor in chronic arthritis

Conclusions

Endocrine disturbances are in general not sufficient by themselves to produce joint diseases, but in a considerable proportion of cases they create a suitable soil for other factors to produce effects harmful to the joints In confirmation of this is the general experience that endocrine therapy may often bring about improvement, but will rarely completely cure a joint disease

(*e*) DIET

Diet is a subject upon which there is great diversity of opinion, and error is very prevalent In rheumatoid conditions the first essential is an adequate supply of simple digestible food, and there is no justification for forbidding any article of food which the patient finds easy of digestion, and to which he offers no idiosyncrasy This matter of idiosyncrasy is important, and careful inquiry should be made Some patients appear to suffer more pain or stiffness after articles of food termed 'acid" —certain fruits and wines, and sometimes malt liquors— though these effects are more often met with in fibrositis than in arthritis Others do well on these 'acid' substances No general rule can be laid down If there is a tendency to put on weight as in climacteric arthritis and osteo arthritis, carbohydrates must be limited

The importance which is now attached to vitamins in diet has practical application in arthritic and fibrositic disorders and the best rule is to see that the diet has its due proportion of each of the essential vitamins Where it is readily assimilated milk is of great service both for its nutrient value and for its vitamin content Fresh fruit and vegetables are also important Attention should be given to the supply of vitamin B by means of wholemeal bread wheat germ legumes etc Vitamin A can be added in the form of cod-liver oil or its derivatives to raise the resistance to infection, and in rheumatoid arthritis vitamin D also is indicated to aid assimilation

Thus the diet in rheumatoid arthritis should include milk butter eggs fish, and meat of digestible kinds including liver and some fat , wholemeal bread yeast extracts fresh fruit and vegetables raw and cooked including peas beans, lentils and, when in season young carrots and turnips Foods outside this list are not necessarily prohibited, and may be taken to gratify taste or appetite so long as adequate amounts of the more important foods are included In fibrositis and chronic villous arthritis excess of carbohydrates must be avoided, and in osteo arthritis, in view of the tendency to arterial degeneration and sclerotic changes purines and excess of meat are contraindicated Those articles of diet which aid in procuring efficient action of the bowels are often specially indicated

(*f*) PHYSICAL TREATMENT

(1) *General*

The objects of physical treatment are (1) to relieve pain , (2) to regulate sweat secretion and superficial capillary circulation , (3) to promote the absorption of fibrous thickenings from muscles, fascia and joint capsules also of old inflammatory exudates, and thus to restore mobility in stiff joints and muscles and (4) to regulate bodily metabolism and to raise (when present) a persistently low temperature and thus to stimulate the defence mechanism of the body

These objects can be attained by (1) the application of heat or of alternations of heat and cold (2) massage , (3) passive and active movements, including mechanotherapy and remedial exercises

Application of Heat Hyperthermal temperatures (above 110° F) are stimulating lower temperatures exert a sedative effect Heat applied to a comparatively small area of the body produces a widespread effect on the whole body through the vasomotor system General application of heat by hot air, or by vapour or immersion baths, will induce sweating, increase superficial capillary circulation resolve inflammatory thickenings and exudates and modify tissue metabolism Local application of heat which should be at as high a temperature as can be borne, may be made by mud, peat or wax, by the hyperthermal douche, by hot air or vapour or by diathermy these measures will relieve pain, superficial or deep and will lessen congestion in deeper parts

Massage is especially useful in dispersing nodules and adhesions in fibrositis It improves the peripheral circulation and maintains muscular tone In bed ridden patients it is a substitute for active exercise If a joint is completely ankylosed, massage to its related muscles is useless Applied to inflamed joints massage is definitely harmful

Movements Mechanotherapy and Exercises When a joint is acutely inflamed movement of it should be avoided except on the occasions when it is placed and splinted in the optimum position , this position may have to be reached in steps by the gradual alteration of the angle of the splint Active—that is, voluntary—movements by the patient himself should precede passive movements , in this way there is less risk of injury to the joint Any increase of pain or swelling or a return of heat to the joint is an indication for further rest In the early stages of treatment especially in osteo arthritis movements should be carried out under conditions which exclude weight-bearing—that is either in the recumbent position or in the hot pool bath in the latter the water, by opposing the action of gravity, lends support to the part while the heat allays pain and relaxes muscular spasm For the same reasons a hot immersion bath may usefully precede the adoption of movements In the later stages of arthritis and in certain cases of sciatica and lumbar pain, manipulation of the spine and of joints is of great service The reputation enjoyed by certain irregular practitioners might be reserved for the medical profession if a greater interest were taken in this branch of therapeutics, and were technical skill in the

THE UNIVERSITY OF LIVERPOOL

FACULTY OF MEDICINE.

THE MEDICAL SCHOOL provides complete courses of instruction for the Examinations of the University of Liverpool and also meets the requirements of other Universities and Examining Bodies in the United Kingdom.

Other Schools of the Faculty are —The School of Dental Surgery the School of Hygiene the School of Tropical Medicine and the School of Veterinary Science

THE CLINICAL SCHOOL

THE CLINICAL SCHOOL consists of FOUR GENERAL HOSPITALS The Royal Infirmary the Royal Southern Hospital the David Lewis Northern Hospital and the Stanley Hospital and of FIVE SPECIAL HOSPITALS The Eye and Ear Infirmary the Women's Hospital Liverpool the Royal Liverpool Children's Hospital the Liverpool Maternity Hospital and the St Paul's Eye Hospital

These Hospitals contain in all about 1 500 Beds

The organization of these Hospitals to form one teaching Institution provides the Medical Student and Medical Practitioner with a field for clinical education and study which is unrivalled in extent in the United Kingdom

Twenty-one house physicians and house surgeons are appointed every six months in the General Hospitals and the majority of these receive salaries ranging from £60 to £100 per annum Five resident medical officers are also appointed at intervals to the Special Hospitals

Infectious Diseases are studied in the Local and District Hospitals and Mental Diseases at the County Mental Hospital Rainhill

For information on all matters concerning the curriculum application should be made to the Dean of the Faculty of Medicine the University of Liverpool.

Information regarding the special regulations for Hospital Practice may be obtained from the Secretary of the School Dr V B CAPON 49a RODNEY STREET LIVERPOOL 1

MARYLEBONE ROAD, N W 1

Medical Students and Qualified Practitioners admitted to the Practice of this Hospital Unusual opportunities are afforded of seeing Obstetrical Complications and Operative Midwifery (about one half of the total admission being *primiparous cases*). Over 2,700 patients are admitted to the Wards annually and in the Ante-natal Department there are over 20 000 attendances per annum

Certificates awarded as required by the various Examining Boards.

For rules fees etc. apply H. B. STOKES Secretary Superintendent.

POST-GRADUATE SCHOOL of RADIOTHERAPY

The Mount Vernon Hospital and Paterson Institute Riding House Street London W 1

Dean Sir Cuthbert Wallace K.C.M.G., C.B., F.R.C.S

A Course in RADIOTHERAPY

especially in its relation to Malignant Disease

will be held at the above School commencing Monday October 2nd 1933

Copy of the syllabus and full particulars may be obtained on application to

THOS. L. GARNER, Secretary

methods more widely distributed The promotion of movement in stiff joints by various kinds of mechanical apparatus has a much more extended use on the Continent than in this country but has little to recommend it Treatment by massage and ordinary active and passive movements produces better results and has the advantage of more reliable control and of personal contact and encouragement

(ii) *Electricity and Radiation*

The objects which may be attained by electrical and allied methods are the relief of pain and stiffness the improvement of capillary circulation and the absorption of fluid effusions from the joints and of inflammatory thickenings from the tissues

The methods used are heat light electric currents and ionization Heat may be applied externally by means of radiant heat lamps or infra red rays the latter are the more penetrating and are of value especially in relieving pain and stiffness and improving circulation In conjunction with massage for which electrical vibrators may be used infra red rays are effective in dispersing the nodules and thickenings of fibrositis

Diathermy is used for heating the deeper structures and is of value in relieving the pain of osteo-arthritis of the hip It is applied also to the pelvic organs by means of intrapelvic electrodes and good results are claimed for this method in the treatment of arthritis It is believed to act upon the ovaries and thus to benefit cases in which there is endocrine disturbance also to have a direct effect on septic foci when these exist in the pelvis It is claimed that the rise of temperature produced destroys gonococci in the cervix or prostate and it is in cases of this kind that the most striking results have been obtained

Ultra violet rays act by increasing the general resistance to infection and by producing a general tonic effect over dosage must be carefully avoided There is no definite evidence of any other beneficial effect in arthritis but in acute fibrositis ultra-violet rays often give relief in sciatica they may increase the pain

Ionization by means of the galvanic current is said to act by driving the ions of certain drugs into the tissues It is used for the relief of pain especially in fibrositis and bursitis also to promote the absorption of effusions from joints and tendon sheaths and the resolution of fibrous nodules and indurations

The faradic current is used in the treatment of muscular wasting especially as an adjuvant to massage The electric cautery is a useful form of counter irritation For the technique of the various methods textbooks must be consulted

X rays No definite opinion can be given as to the value of *x* rays in the treatment of arthritis It would appear that *x* ray therapy especially with deep rays is used somewhat indiscriminately yet experienced practitioners declare that they have observed definite benefit in chronic arthritis especially in spondylitis from this form of treatment Used with due precautions the method would seem to be without danger

(iii) *Mineral Waters and Baths*

Mineral waters may be divided into six groups (*a*) thermal springs of low mineralization (*Bath and Buxton*) (*b*) saline and sulphated (*Bridge of Allan Cheltenham Harrogate and Leamington*) (*c*) sulphur (*Harrogate Llandrindod and Strathpeffer*) (*d*) iron (*Buxton Harrogate Llandrindod Strathpeffer and Trefriw*) (*e*) bromo-iodine (*Woodhall*) (*f*) strong saline not used internally (*Droitwich*)

(*a*) *The waters of low mineralization* are hypotonic and act as strong diuretics clinically their radioactivity has some effect on metabolism

(*b*) *Saline and Sulphated Waters* The weaker waters taken fasting increase gastric tone and promote diuresis the stronger ones augment intestinal secretion and are mild aperients The sulphated waters are purgative they are useful in the reduction of fat and of abdominal plethora

(*c*) *Sulphur Group* Sulphur has a powerful action on tissue metabolism The sulphur group of mineral waters includes (1) the *hypertonic* which are purgative increase the flow of bile and stimulate metabolism (2) the *isotonic* with similar but milder action and (3) the *hypotonic* which are diluents and diuretics

(*d*) *Iron or chalybeate waters* vary in strength from the strong sulphate of iron wells of Trefriw Spa and the strong chloride of iron well of Harrogate to the mild chalybeate waters of Buxton Llandrindod Harrogate and Strathpeffer They improve the haemoglobin value of the blood

(*e*) *The Bromo iodine Waters of Woodhall Spa* These are saline and contain an appreciable quantity of iodine and bromine Their special virtue lies in their iodine content and they are therefore alterative in action

Cases of primary and secondary rheumatoid arthritis with much debility often show improvement with radioactive thermal waters and where there is considerable anaemia the chalybeate waters are well borne and assist in building up the patient's general condition In the convalescent stages of the secondary rheumatoid groups when the focal sepsis has been dealt with stronger iron waters may be employed In cases of secondary rheumatoid arthritis chronic villous arthritis osteo-arthritis and fibrositis associated with plethora overfeeding and obesity the hypertonic sulphur waters are useful and a course of these may be followed by one of the chalybeate waters In all forms of arthritis with the exception of the primary rheumatoid type associated with intestinal toxaemia the isotonic and hypotonic sulphur springs and the saline sulphated waters are extensively used

Natural mineral waters are held to be of prophylactic value against the development or recurrence of disorders of metabolic origin Periodic courses are voluntarily undertaken by many persons who are subject to attacks of muscular rheumatism lumbago and sciatica and who find substantial benefit from this method

The main types of bath commonly in use are

General Baths

(1) Immersion baths—
  (*a*) Deep pool baths
  (*b*) Reclining baths
(2) Douche massage baths
(3) Mud baths
(4) Vapour baths
(5) Dry hot air baths

Local Baths

(*a*) Externally applied—
  (1) Undercurrent douches
  (2) Low pressure effusion douches
  (3) High pressure douches (jet douches needle baths etc)
  (4) Local mud packs

(*b*) Internally applied—
  Intestinal lavage

These methods produce certain reactions by virtue of their (1) *Thermal effects* Baths are sedative or stimulant according to temperature (see p 1046) (2) *Percussion effects* Undercurrent douches massage douches jet douches needle baths etc produce local effects by direct action and general effects by reflex action through the nervous system

ROYAL MEDICAL FOUNDATION

ELECTION OF FOUNDATIONERS AND PENSIONERS

The following were elected by the CONJOINT COMMITTEE on June 14th, 1933 —

FOUNDATIONERS

Edward H Couper — William J Dunlop
Hugh W Macintyre — William M Pinder
Anthony G Quinlan — George L H Steede
Robert S Sunderland — Peter B Verver
Robert D West — Brian H Harriss
Michael R Tosswill

PENSIONERS

Mrs. Mary J Lindsay — Dr Herbert Blott

W L GIFFARD (Major) Secretary

ROYAL SOCIETY OF MEDICINE

NICHOLS PRIZE—FOURTH AWARD

In accordance with the will of the late Dr Robert Thomas Nichols, the Royal Society of Medicine offers every three years a prize (being the accumulated interest on £2,200) open to any British subject for the most valuable contribution towards The Discovery of the Causes and the Prevention of Death in Childbirth from Septicaemia

Work submitted for the fourth award must reach the Secretary of the Society (1, Wimpole Street London W 1), not later than October 1st 1933 and must be marked 'Nichols Prize It must be typewritten or printed in English and accompanied by the name and address of the author

Work already published may be submitted provided that publication was not earlier than October 1st 1930

If no work of sufficient merit be submitted the prize will not be awarded

CENTRAL LONDON OPHTHALMIC HOSPITAL Judd Street, W C 1

There will shortly be a vacancy in the Orthoptic Department for a STUDENT (female) Full particulars may be obtained on application to the Secretary

CITY OF NOTTINGHAM

ASSISTANT MEDICAL OFFICER OF HEALTH

Applications are invited for the appointment of Assistant Medical Officer of Health (male) to commence duty on October 1st

The duties will include assisting the Medical Officer of Health in the administration of the Maternity and Child Welfare Department, taking medical charge of certain Infant Welfare sessions undertaking medical duties of a non-specialist type at the Tuberculosis Clinic, together with such other duties as may from time to time be allotted

The possession of a Diploma in Public Health is essential

Service with other Local Authorities will be taken into consideration in fixing the commencing salary which will be on the scale £500, rising by annual increments to £700

The appointment will be subject to the provisions of the Local Government and Other Officers Superannuation Act 1922, and to one months notice on either side

The successful candidate will be required to live within the City Boundary and to pass a medical examination

Applications must be made on a form to be obtained from me and must be addressed so as to reach me not later than July 15th

Guildhall W J BOARD
Nottingham Town Clerk
June 19th 1933

HEREFORD COUNTY AND CITY MENTAL HOSPITAL

Wanted, a SECOND ASSISTANT MEDICAL OFFICER (male unmarried) not exceeding 40 years of age doubly qualified, and registered under the Medical Act Salary £350, rising by increments of £25 to £400 subject to a temporary reduction of 4 per cent with board, furnished apartments laundry etc.

Ample opportunities exist for research with trained laboratory assistance in bacteriology, pathology and [illegible] Preference will be given to a [illegible] tory experience, and to c [illegible] in Psychological Medicine

The appointment is subject to the provisions of the Asylum Officers Superannuation Act 1909

Applications with one or more personal references to be made to the Medical Superintendent County and City Mental Hospital Burghill, Hereford

CITY OF BIRMINGHAM

APPOINTMENT OF CONSULTANT MEDICAL OFFICER FOR THE POLICE FORCE AND FIRE BRIGADE.

The Watch Committee invite applications from qualified medical gentlemen for the position of Consultant Medical Officer for the Police Force and Fire Brigade

The Committee have fixed the remuneration at Two Hundred and Fifty Guineas per annum but this amount in common with police salaries and wages generally will be subject to a temporary economy abatement The amount of the abatement in this case has been fixed by the Watch Committee at Twenty two guineas, leaving a net annual remuneration of Two Hundred and Twenty-eight guineas

Intending applicants should communicate with the Chief Constable, Newton Street Birmingham, who will be pleased to furnish full particulars and details of the duties attaching to the appointment

Applicants should be gentlemen practising in the City of Birmingham

The strength of the Birmingham Police Force is 1,687, and of the Fire Brigade 300

Applications to be made to me not later than Saturday July 8th

The Council House F H C WILTSHIRE
Birmingham Town Clerk
June 14th, 1933

CITY OF BIRMINGHAM

SELLY OAK HOSPITAL (500 Beds)

CASUALTY OFFICER (MALE)

Applications are invited from fully qualified Medical Practitioners for whole time appointment as Casualty Officer' (male) at the Selly Oak Hospital, Birmingham The appointment will be for a period of six months in the first instance, but may be extended at the end of that time for a further period of not exceeding six months

Salary at the rate of £200 per annum and full residential emoluments The salary and emoluments will be subject to any voluntary abatement in force from time to time

The officer appointed will be required to refund to the Council all fees allowances and emoluments (other than the foregoing) received by him

Further particulars may be obtained from the Medical Superintendent at Selly Oak Hospital, to whom applications stating age experience and qualifications, with copies of recent testimonials should be forwarded not later than Wednesday, July 12th

F H C WILTSHIRE,
The Council House, Town Clerk
Birmingham June, 1933

CITY OF BIRMINGHAM

DUDLEY ROAD HOSPITAL (926 Beds)

Applications are invited from fully qualified Medical Practitioners for whole time appointment as JUNIOR MEDICAL OFFICERS (male) at the Dudley Road Hospital, Birmingham The appointment will be for a period of six months, but may be extended for a further period of not exceeding six months Salary at the rate of £200 per annum and full residential emoluments, subject to any voluntary abatement in force from time to time The officer appointed will be required to refund to the Council all fees allowances and emoluments (other than the foregoing) received by him

Further particulars may be obtained from the Medical Superintendent at Dudley Road Hospital to whom applications stating age experience, and qualifications, with copies of recent testimonials should be forwarded not later than June 29th

CENTRAL LONDON OPHTHALMIC HOSPITAL Judd Street, St Pancras, W C 1

Applications are invited for the posts of SENIOR and JUNIOR HOUSE SURGEON Candidates must be registered Medical Practitioners Salary £120 and £100 per annum respectively with board and residence in the Hospital The appointments are for six months from July 15th The Junior House Surgeon is a candidate for the Senior post

Applications, with copies of three testimonials should reach the undersigned on or before June 30th

GEORGE WATTS, Secretary

CHARING CROSS HOSPITAL.

Applications are invited for the post of HONORARY CLINICAL ASSISTANT to the Dermatological Department

Applications, together with copies of three recent testimonials should be sent to the undersigned not later than July 1st

PHILIP INMAN, House Governor
Charing Cross Hospital London W C 2.

The *physiological effects* may be summarized as follows

1 *On the Skin* (*a*) Thorough cleansing removal of dried sebaceous material and epithelial debris, thus getting rid of mechanical obstructions to openings of the sebaceous ducts and tubules of sweat glands, (*b*) stimulation of excretion of sweat, with consequent relief of the kidneys

2 *Cardiovascular System* Alteration in rate and volume of blood flow through the skin and subcutaneous tissues, and stimulation through nervous channels of the vasomotor and respiratory centres in the medulla

3 *Kidneys* Diuresis

4 *Central Nervous System* Stimulation of "cutaneo-sympathetic" reflex, thus improving the adaptation of the body to changes of temperature Undue susceptibility to such changes appears to be closely associated with a tendency to arthritic disorders

5 *Metabolism* Increase of metabolic rate

Intestinal lavage This may be of benefit in some cases of arthritis, but a prolonged course or frequent repetition may be harmful

On the Reputed Specific Therapeutic Properties of the Different Natural Waters when Applied Externally in the Form of Baths

There is an old-standing and widely spread popular belief that individual "waters" externally applied have a selective therapeutic action on particular diseases As the skin is incapable of absorbing any appreciable amount of the chemical ingredients of any "natural water, it follows that any therapeutic action which follows immersion (apart from that on cutaneous disorders) must depend entirely on the physical qualities possessed by the water Different waters produce different effects on the skin according to the degree of stimulation or irritation they exert on the sensory nerve endings, and in this connexion there are definite variations between waters of different degrees of hardness, waters containing large quantities of brine, and so forth Any such variations between the actions of different waters are, however, of secondary importance to the effects attributable to the water as a medium for the conveyance of heat, of pressure, and of percussion, and the skill with which the methods are used is in many cases more important than the exact type of water

Whether certain "natural" waters produce specific effects in virtue of their radio activity is a question on which it is impossible to dogmatize The degree of radio-activity present even in those waters which possess this property at all is admittedly small, but in view of the recognized therapeutic effects of small doses of radium emanation in various forms of treatment it is not unreasonable to assume that the radium emanation in natural waters, when these are used as baths may exercise some physiological and perhaps also a therapeutic influence Such a contention, however can at present neither be proved nor disproved

Contraindications to Spa Treatment

1 Arthritis in the acute stage
2 Tuberculosis
3 Severe cardiovascular disease
4 Malignant disease
5 Advanced renal disease

(*g*) CLIMATE AND HYGIENE

The value of climate as a therapeutic factor is not easily defined not all patients react in the same fashion to similar influences and hence personal idiosyncrasies are apt to confuse the issue In general terms climate has no influence on osteo-arthritis but in rheumatoid arthritis it may be utilized to stimulate metabolism and to increase the patient's resistance Generally cold or cool temperatures are to be preferred, provided there is protection from wind and damp, hot humid, and relaxing climates are unfavourable Sunshine has a generally beneficial effect, especially in fibrositis, narrow river valleys, and the proximity of large sheets of water exercise an unfavourable influence For a choice between the seaside and inland places there is little guidance except the experience of the individual patient

The site of a residence is of some importance in particular, the soil and house should be well drained, and this is effectively secured in a gravel or sandy district rather than in a clay one Closely packed slum dwellings with absence of cellars or any ventilated space between the floors and the earth are especially harmful Other things being equal soft water is much to be preferred This applies especially to osteo arthritis and fibrositis, but is of less importance in rheumatoid arthritis

X ORTHOPAEDIC AND SURGICAL

Spine (spondylitis) In the active stage in order among other things, to prevent depression of the viscera by bad posture, the patient suffering from spondylitis or other active spinal disease should be recumbent on a firm bed lying on his back with a small pillow below his head and another below his knees Thrice daily after meals he should be placed in a position of hyperextension of the spine for half an hour For this purpose a pillow is placed beneath the thorax, the lumbar spine is unsupported, and the hands are clasped behind the head He is then rolled over to lie face downwards on a pillow extending from the top of the sternum to the pubes, and in this position treatment by heat or counter-irritation may be applied In more severe cases a plaster bed is necessary The foot of the bed should be raised The period of recumbency should not be less than one month, and may require to be considerably more Later, massage and exercises, first lying and then standing, are indicated Throughout this period breathing exercises are essential When the patient is allowed to get up, a spinal support in the form of a brace and pelvic corset is necessary In progressive cases firm ankylosis lessens the local discomfort, and if this takes place in a good functional position the patient is able to get about with comfort Where the cervical and upper dorsal vertebrae are affected there is often considerable flexion deformity of the trunk and neck, together with torticollis In these cases the head must be supported by pillows, which are gradually withdrawn to allow gravity to act as the remedial agent, traction by means of a head sling with weight and pulley may be necessary In other cases, where the cervical spine alone is affected, a Thomas collar affords a sufficient support

Sacro-iliac Joint Disease in this joint may be treated either (1) by the methods described above, or (2) by prolonged fixation, or (3) by operation—the Smith Peter on method being generally adopted

Hip joint Weight-bearing on the affected joint always leads to a state of progressive flexion and adduction therefore rest and fixation are the first requirements While the disease is active and pain and muscular spasm are present, rest in bed with traction by weight and pulley and fixation are indicated When the acute stage has passed the patient may benefit greatly by simply using crutches, and keeping the weight off the limb by a thickened sole on the boot of the sound limb Use within limits, short of irritating the joint is a valuable aid in maintaining function If however, activity produces pain which is persistent and lasts for a period after the activity ceases he is using the joint too freely and additional protection is required After the acute symptoms

have subsided gentle massage to the muscles is very useful combined with movements in the direction of abduction and extension short of causing pain or muscular spasm These movements however must not be repeated more than two or three times at each sitting Stimulation of the hip muscles electrically and muscle training by non weight bearing exercises should be encouraged To prevent undue movement when getting about a walking calliper splint may be used or a laced elastic spica in which are incorporated felt straps or flexible canes passing in from behind and over the trochanter gives very efficient protection and yet allows the patient to sit down When the affection is painful destructive and advanced surgical measures whether by fixation manipulation under an anaesthetic or operation are indicated When the condition is quiescent and there has not been great damage to the head of the bone great relief may be obtained by gentle manipulation of the joint under general anaesthesia Radiant heat massage and active weight bearing movements should follow as soon as possible in order to maintain what has been gained Under the anaesthetic it is possible to discover whether the attitude of adduction and flexion is merely due to muscle spasm or whether there is definite shortening of the adductor muscles In the latter event tenotomy of the adducter tendons is necessary followed by fixation of the hip in abduction for two weeks and application of massage and movements (This operation which is not free from the risk of phlebitis can be done under nitrous oxide anaesthesia without causing shock) Operative measures on the joint should be undertaken only when severe pain and disability are present The majority of these patients are old and often stout with myocardial weakness There is always great danger of primary shock especially where the head of the bone requires to be disarticulated

Knee joint The deformities which develop are those of flexion backward subluxation of the tibial head and outward rotation of the lower leg from the pull of the biceps In early stages this condition may be improved by simple weight and pulley traction but in many cases the question will arise as to whether the knee joint should be manipulated under anaesthesia Several attempts may have to be made and great care must be taken as even the mildest manipulation may produce fat embolism The manipulation should not be attempted unless the patella is freely movable Where flexion deformity exists an operation to lengthen the hamstring tendons may be performed In other cases a transverse osteotomy of the femur may be employed straightening the limb on a splint Synovectomy is sometimes attended with the happiest results When it is found that the patella is becoming ankylosed to the femur the operation may be completed by inserting a strip of fascia lata between the two bones In cases where there is much deformity with bone destruction a formal excision often gives the best result Mild cases of flexion can be controlled by a walking calliper splint with a pad over the patella

Ankle and Foot In chronic arthritis of these joints every effort must be made to retain movement and a good functional position In the active stage if immobilization is required it must be in the optimum position especially if fibrous or bony ankylosis is probable In the ankle joint the optimum position is one of dorsiflexion and very slight varus or inversion Disabling positions such as valgus equinus calcaneus or combinations of these should if possible be avoided This may be achieved by splinting the foot and ankle in a good position by means of plaster casing leather or celluloid splints The celluloid splint being light and durable and perfect fitting is the best In the more severe cases surgical intervention in the form of manipulation under an anaesthetic or operation is sometimes necessary The stiffness may be due to intra or extra articular adhesions or may result from destruction of the cartilage and ankylosis In simple adhesions the movements of the joint should not diminish with use If the adhesions do not yield to functional use of the limb or to passive movements they may be broken down under a general anaesthetic When ankylosis has taken place in a good position and there is no pain the condition may be left alone If however the ankylosis is incomplete with pain and deformity the position may be corrected under general anaesthesia either manually or by a Thomas wrench The limb is put up in plaster-of Paris in a position of dorsiflexion and neither inverted nor everted In cases in which the periarticular adhesions snap suddenly and greater freedom of movement results a movable joint should be attempted Massage and movements are therefore begun early Before deciding to manipulate any joint which has been the site of infection it is well to bear in mind the risk of a lighting-up of latent infection To be sure that this will not happen is impossible Some advise preliminary treatment by radiant heat and vigorous massage to see if such measures provoke increased heat and pain in the joint If they do manipulation should not be attempted and in most cases it is a good rule to let six months elapse between the subsidence of the infection and manipulation Pain and limitation of movement in the great toe joint are common from chronic arthritis of the metatarso-phalangeal joint of the great toe The surgical treatment of hallux valgus and rigidus and hammer-toe is described in surgical textbooks Metatarsalgia is a common complaint in the arthritic On examination swelling of one or more of the metatarsal joints hyperextension of the toes and spreading of the fore part of the foot due to muscle weakness are found

Treatment requires examination for faulty statics The shoe should have a thick sole broad enough to prevent lateral compression of the toes the direct aim of treatment being to restore the anterior arch correct the clawing of the toes and increase the power and function of the lumbricales and interossei muscles A metatarsal bar may be placed across the sole under the tread just behind the heads of the metatarsals or a felt pad made of leather oval in shape 1¼ in long by 1 in broad and 1/4 in thick with bevelled edges fixed to the inside sole by adhesive strapping may be employed or again a metal support can be slipped into the shoe Success in any of these methods depends on minute attention to detail in making and fitment Exercises to get rid of clawing and to increase flexibility and the strength of the toes and arch are very important Rest and attention to the shoeing and associated flat-foot may in some instances be all that is required

Shoulder joint In chronic arthritis impaired mobility rigidity of muscles and contractures from permanent shortening of muscles tendons and fascia are present When the articular surfaces are affected fibrous or bony ankylosis may occur The all important fact to be noted is that if ankylosis is inevitable the joint must be fixed in the optimum position for function and the ankylosis must be firm In the shoulder ankylosis in adduction means bad function The position to be selected is one in which the upper arm is abducted 60 degrees and externally rotated 15 degrees as from the horizontal The elbow is brought forward so as to be in the same vertical plane as the front of the chest the patient being able to carry his hand to his mouth by means of scapular movement

Synovitis Bursitis and Periarthritis These may be present at one and the same time At first abduction and external rotation are generally affected but later all

INDIAN MEDICAL SERVICE

Recruitment of European Officers.

Applications are invited from medical men for permanent commissions in H.M.'s Indian Medical Service The terms offered include a gratuity of £1,000 on retirement after six years' service, or £2,500 after 12 years' service, together with free return passages for those who no longer desire to remain in the Service In other respects the terms will be as detailed below

Candidates must be European British subjects under 32 years of age at the time of application and must be registered under the Medical Acts in force in Great Britain and Northern Ireland

CAREERS

The Indian Medical Service offers wide opportunities of medical experience including clinical preventive specialist and research work At the beginning of his career an officer is employed on the military side which has medical charge of the Indian Army Promotion is on a time scale up to the rank of Lieutenant-Colonel and by selection to the ranks of Colonel and Major General An officer may apply after one year's Indian Service to have his name registered for transfer to the civil side from which appointments are made to Civil Surgeoncies which are established at the principal civil centres to provide for the medical needs of civil officials and for general medical administrative purposes to specialist (for example public health and bacteriological) services to research posts and to professorships at the Medical Schools

NOTE.—It is not possible to state at present what, if any prospects of employment on the civil side will be open to Indian Medical Service Officers under the proposed new constitution for India.

PAY

Owing to the state of the financial emergency at present prevailing in India the existing monthly rates of pay which are as follows are subject to a temporary reduction of 5 per cent

Rank	Service in Rank.	Rate of Pay	Overseas Pay	Year of Total Service.
		Rs	Rs	
			100	1st
Lieut.	—	600	100	2nd
			100	3rd
			100	4th
Capt	(i) During first 3 years service as Captain	650	£15	5th
			£15	6th
	(ii) With more than 3 and less than 6 yrs service as Captain	750	£25	7th
			£25	8th
			£25	9th
	(iii) With more than 6 years service as Captain	850	£25	10th
			£25	11th
			£30	12th
Major	(i) During first 3 years service as Major ...	950		
	(ii) With more than 3 and less than 6 years service as Major	1100		
	(iii) With more than 6 years service as Major ..	1250		
Lieut.-Col	(i) Until completion of 23 years total service	1 00	£30	13th and over
	(ii) During 24th and 25th years service	1600		
	(iii) After completion of 25 years total service ..	1 00		
	(iv) When selected for increased pay ...	1800		

EXTRAS.—In addition to the above rates various allowances are admissible for a large number of special appointments on both the military and the civil side which may be held by members of the Indian Medical Service Special high rates of pay are also attached to the numerous administrative appointments open to officers in both branches of the Service.

ANTEDATES IN COMMISSION

Any service rendered by an officer during the war as a medical or combatant officer or in a position usually filled by an officer may be counted as service for increments of pay promotion retirement and retired pay but not for gratuity

One half of any service in the ranks during the war may be counted as service for retirement and retired pay only

Candidates possessing certain higher medical qualifications may be granted an antedate of one year in their commissions Past service in certain hospital appointments may also render candidates eligible for an antedate of one year Persons holding or about to hold resident posts at recognized hospitals may be seconded in those posts for a period not exceeding one year The maximum period of antedate secondment, or antedate and secondment combined admissible under this paragraph is limited to one year

OUTFIT ALLOWANCE.

Officers on appointment will receive an allowance of £50 towards the cost of outfit.

PRIVATE PRACTICE

With the exception of Administrative Officers military or civil and officers holding certain special appointments officers are not debarred from taking private practice so long as it does not interfere with their proper duties

LEAVE

Leave can be taken at reasonable intervals and adequate rates of leave pay are provided Extra leave (known as study leave) which may not exceed 12 months in all during an officer's service may be granted to officers desirous of pursuing special courses of study of a post graduate nature During such leave study allowance at present fixed at the rate of 12s a day in the United Kingdom £1 a day on the Continent of Europe and £1 10s a day in the United States of America is granted to an officer in addition to ordinary rates of leave pay

PENSIONS

The rates of pension are as follows	Per annum £
After 17 years service for pension	400
18	430
19	460
20	500
21	540
22	580
23	620
24	660
25	700
26	750
27	800

These rates are subject to alteration on account of a rise or fall in the cost of living as compared with the year 1919 to an extent not exceeding 20 per cent in all At present a reduction of 8⅓ per cent is being made on this account.

There are additional pensions ranging from £65 to £350 per annum for officers who have held administrative appointments

PASSAGES.

An officer on appointment is provided with free passage to India The families of officers who are married prior to the date of the officers embarkation on first appointment will also be provided with free passage to India subject to the payment of messing charges

Officers and their families are also eligible for passage concessions under which they are granted a certain number of return passages home at Government expense during their service

INSTRUCTION PRIOR TO EMBARKATION

Officers are required to undergo courses of instruction at the Royal Army Medical College and at Aldershot lasting approximately six months prior to their embarkation for India on first appointment Information as to the rates of pay admissible during this period and subsequently up to arrival in India is contained in the memorandum referred to below

A memorandum giving full details regarding these appointments and forms of application may be obtained from the Under-Secretary of State for India Military Department, India Office, London S W 1 The Selection Committee will meet at the India Office early in July next, and the selected candidates will be required to join a course of instruction commencing early in August prior to sailing for India early in 1934 Applications should be submitted as soon as possible

CARDIFF ROYAL INFIRMARY
(Associated with the Welsh National School of Medicine)

HONORARY PHYSICIAN REQUIRED

Applications are invited for the vacancy arising in the office of Honorary Physician
The regulations provide that Each Honorary Physician and Honorary Assistant Physician shall be a Graduate in Medicine of a University of the United Kingdom and he shall not practise Surgery or Midwifery He shall also be or within a year of his appointment shall become a Fellow or Member of the Royal College of Physicians of London, or a Fellow of one of the other Royal Colleges of Physicians in the United Kingdom
The present Senior Assistant Physician is a candidate for the vacancy
Each candidate is required to send fifty copies of his application and testimonials (for circulation amongst members of the Election Committee and Medical Board) stating age, qualifications appointments held etc and endorsed Honorary Physician" to reach the undersigned on or before Saturday, July 8th
LEONARD D REA
June 19th, 1933 Secretary

ROYAL EDINBURGH HOSPITAL FOR SICK CHILDREN

Wanted for this Hospital, TWO HONORARY RESIDENT HOUSE SURGEONS and THREE HONORARY RESIDENT HOUSE PHYSICIANS one of the latter shall have charge of both a medical ward and an ear and throat ward, the appointment shall commence on October 2nd, and shall be for a period of six months Information as to duties etc can be obtained from the ordinary physicians and surgeons at the hospital Thirty copies of applications and relative testimonials to be lodged, on or before July 22nd with Messrs HENRY & SCOTT, W S 50 Frederick Street Edinburgh No application will be received after that date

WARRINGTON INFIRMARY AND DISPENSARY

The Board of Management invite applications for the post of JUNIOR HOUSE SURGEON (male), unmarried Applicants, who must be of British nationality must be duly qualified Medical Practitioners Salary £175 per annum with board apartments and laundry Applications, stating age with copies of three recent testimonials should be sent in at once to the undersigned
By Order
HENRY I BOOT
June 19th 1933 Supt & Secretary

DERBYSHIRE HOSPITAL FOR SICK CHILDREN (80 Beds)

Wanted July 1st RESIDENT HOUSE PHYSICIAN (lady) Salary £130 p a The appointment is for twelve months Applicants must be fully qualified Applications with three testimonials, one relating to anaesthetics to be sent to the undersigned forthwith
ARTHUR N WHISTON
25 St Mary s Gate Secretary
Derby

DERBYSHIRE HOSPITAL FOR SICK CHILDREN (80 Beds)

Wanted July 1st a RESIDENT HOUSE SURGEON (lady) Salary £130 p a The appointment is for twelve months. Applicants must be fully qualified Applications with three testimonials one relating to anaesthetics to be sent to the undersigned forthwith
ARTHUR N WHISTON
25 St Mary s Gate Secretary
Derby

ROYAL ELF HOSPITAL,
St George s Circus Southwark S E 1

The Council invite applications for the appointment of HONORARY PHYSICIAN to the above Hospital Candidates must be a Graduate of Medicine of a British University and a Fellow or Member of the Royal College of Physicians of London
Applications with copies of testimonials, to be sent to the Secretary on or before July 1st
F E D ALTON Secretary

DREADNOUGHT HOSPITAL GREENWICH S E 10 (Seamen s Hospital Society)

HOUSE PHYSICIAN required for six months from July 1st Salary £110 per annum and a proportion of fees with board residence and laundry Candidates must be male Applications with copies of three testimonials to be sent in by June 26th to the undersigned
Greenwich R E V BAX
June 10th 1933 Secretary

H G LEWIS Secretary Supt

APPOINTMENT OF HONORARY DIRECTOR OF ORTHOPAEDICS

The Council invites applications for the above appointment which carries with it all the privileges of an Honorary Surgeon
Applications (with copies of testimonials) must be in writing and addressed to the Chairman ROYAL LIVERPOOL CHILDREN S HOSPITAL Myrtle Street Liverpool 7 by Friday July 7th
A candidate may send copies of his application and testimonials to members of the Election Committee but personal canvassing of any member will be a disqualification
R H ARMISTRONG Chairman

movements In long-standing cases wasting of the biceps and triceps may weaken the muscular support of the joint, with an increase of the liability to subsequent strain The shoulder should be treated by physical methods, with rest of the limb in an abduction splint In resistive cases adhesions may be gently broken down under a general anaesthetic Many of these cases are associated with fibrositis in the muscles of the shoulder and upper arm In some cases also there is a tendency to the formation of a calcified deposit in the tendon of the supraspinatus muscle—a condition attended by much pain and capable of demonstration by *x* rays , it may require operation

Elbow The elbow when affected should be kept active as long as possible, but if immobilization and rest seem indicated the joint should be fixed in a position of about 100 degrees extension If both elbows are affected, immobilization in one should be at less than 90 degrees and in the other over 100 degrees extension with the forearm in mid-pronation or 15 degrees short of complete pronation When the condition is quiescent an attempt at movement may be made under anaesthesia, followed by physical treatment, provided due precautions are taken If sound ankylosis takes place nothing should be attempted, though in certain cases mobility may be restored by excision of the joint To restore pronation and supination when they are lost, the head of the radius may have to be removed

Hand and Wrist Physical treatment and special splinting may here accomplish much when deformity, stiffness, and loss of function have developed or seem unavoidable In many cases of chronic arthritis especially in elderly people who rise from a chair by resting their weight on their hands it is noticeable in *x*-ray photographs that the breadth of the carpus as a whole is increased A protective wristlet of leather, which holds the bones in proper relationship, often completely relieves this condition In view of the enormous importance of flexibility of the joints of the hands, and especially of the opposing power of the thumb, great efforts to retain these functions should be made in the early stages of arthritis If the wrist is stiff in palmar flexion and ulnar deviation, it may be possible to change the bad position to a good one by gradual correction in a suitably moulded cock-up splint or by gentle reposition under anaesthesia, followed by immobilization in a plaster casing

Fingers Forcible manipulation of stiff fingers under anaesthesia should never be attempted , the results are invariably bad Steady and prolonged traction, which aims at taking a direct pull from the finger-tips in the line of the deformity so as to produce actual separation of the joint surfaces, with stretching of adhesions in the tendon sheaths is the best single aid for the restoration of movement and function This traction should continue in the line of deformity until evidence of joint separation is seen by depression of the skin over the knuckles or by *x* rays The direction of the traction should then be changed day by day in the direction of flexion Traction should be eased several times a day for passive and active movements and the ability to carry out actively what has been gained passively is the indication for altering the line of pull The treatment should cause no pain or reaction, and the traction pull should not be excessive a pull of 4 oz is sufficient to separate the joint surfaces of a normal finger

XI NATIONAL SCHEMES FOR TREATMENT

HOLLAND

The Dutch League for Combating Rheumatic Diseases, with headquarters in Amsterdam supervises the treatment of arthritis in Holland In addition to the therapeutic activities of this organization it concerns itself with the prosecution of research Its most recent activity in this respect is an inquiry into the incidence of rheumatism in various occupations

GERMANY

The information from Germany discloses a general scheme for the treatment of rheumatic diseases which is largely in being, though not complete The out patient departments may be associated with general hospitals, but are usually special centres established by the friendly societies The in-patient departments may be in general hospitals, but are often in the special "friendly society centres" The convalescent homes are established by the friendly societies

The special centres for spa treatment may be established in any large city, but it is recommended that they should be situated in "spas" where the resources of natural therapy are available

It is recommended that rheumatic cases should be distributed as follows

Out-patient Physiotherapy Centres

1 Acute muscular rheumatism
2 Mild cases of primary rheumatoid arthritis
3 Mild cases of spondylitis deformans
4 Neuritis and neuralgias
5 Elderly patients who are unlikely to benefit from or to tolerate spa treatment

In-patient Physiotherapy Centres

Acute rheumatism
Arthritis of uncertain origin in order to recognize and exclude tuberculosis, new growth, etc

Convalescent Homes

Convalescents from acute rheumatism

Spa Centres

SWEDEN

Existing Hospital Provision

In seven hospitals special departments have been built by the Royal Pensions Board for the treatment of rheumatic disease in its more acute phases , each contains fifty-five to sixty beds As many as 2,500 cases are treated in these departments annually , two thirds of the cost is borne by the Royal Pensions Board and one third by the patient himself, or by benefit funds, or by the commune to which he belongs The treatment consists of physical therapy, all varieties of baths, massage hot air, light, electrical, *x* ray, and orthopaedic methods drugs, and protein shock Patients are attended if necessary, by a dentist Some patients after treatment are trained for several years in an occupation suitable to their disability

A patient stays seventy five days in any one of these hospitals and is eligible for one or two periods of treatment of the same duration during the following years In any event he is visited once a year for several years by an official of the Royal Pensions Board to report progress This arrangement has given good results, and 62 per cent of the patients are able to maintain themselves economically three years after the completion of their course It is found, however, that there are not enough of these centres , indeed, twice as many are required The waiting time for patients at present is six to eight weeks No out-patient departments are maintained at present

As further developments the university hospitals hope to establish out-patient and in patient clinics for rheumatic disease, and corresponding plans have been arranged in connexion with the university clinic in Stockholm and also in the municipal hospital for Stockholm , the latter when built will contain a rheumatic department of seventy beds together with an out patient department

The Royal Pensions Board administers three sanatoriums for chronic rheumatic disease with a total of nearly 500 beds these admit patients who are not confined to bed and whose condition is suitable for physical treatment To each sanatorium two to four medical men are attached with the necessary nursing staff masseuses bath attendants etc

The Royal Pensions Board corresponds in a large measure to our national health insurance scheme Contributions are however levied from almost every member of the community between the ages of 16 and 66 Thus in 1925 3 628 000 citizens were liable to contribute and only 240 000 were exempt The annual pensions contribution consists partly of a flat basic contribution of 7 kronor per head and partly from those who are liable for income tax of an additional contribution the amount of which depends on the assessed income (minimum 2 kronor maximum 30 kronor) These contributions are paid into the Pensions Insurance Fund and used for treatment purposes 55 per cent has been defrayed out of public funds and 45 per cent out of the Pensions Insurance Fund but for the budget of 1927–8 it was calculated that the Fund would pay 92 per cent and the State 8 per cent of the expenses of these activities

Spas

There are about fifty spas in Sweden mostly with iron waters They are all private and as a rule open only in summer Certain industrial cases are treated at these spas at the charge of benefit funds

Hospitals for totally disabled patients and belonging to local authorities take in a certain number of chronic arthritics

SUGGESTED NATIONAL SCHEME FOR GREAT BRITAIN

For this certain conditions must be satisfied namely

1 Early recognition
2 Thorough treatment in the early stage of the disease
3 Adequate follow up of cases in order to observe the effects of treatment to arrange for further courses of treatment when necessary and to secure readmission if required to treatment centres in case of relapse

In addition the scheme

1 Must not interfere with the proper relation between patient and family doctor more than is necessary to ensure the best interests of the patient
2 Must utilize existing facilities for diagnosis and treatment either in private consulting rooms or in public institutions
3 Must be economically sound

Some type of general organization is necessary to secure and apply these conditions Recognition must be the province of the family doctor Extra facilities will have to be given to provide post graduate instruction in this field In the earlier stages treatment can be carried out very largely by out patient methods at or in the neighbourhood of the patient's home but a certain proportion will require in patient treatment or treatment away from their homes for longer or shorter periods

After the case has been investigated and when possible and desirable aetiological factors have been dealt with either in the patient's home or by means of facilities afforded in hospitals nursing homes etc the treatment will include some or all of the following

(i) General regime rest fresh air diet
(ii) Specific treatment (vaccines etc)
(iii) Drugs (including organotherapy)
(iv) Physical treatment heat massage electricity remedial exercises hydrotherapy
(v) Spa treatment
(vi) Orthopaedic manipulative and other surgical treatment
(vii) Occupational therapy

(i) *General Regime*

General regime will be carried out in conjunction with other forms of treatment

(ii) *Specific Treatment* (iii) *Drugs*

These forms of treatment could be undertaken in large measure by the family doctor in the patient's home and in the case of (ii) in collaboration with the pathological department of the general hospital It is probable that special financial provision would require to be made for materials preparation of vaccines special drugs etc

(iv) *Physical Treatment*

All general hospitals should have a physiotherapy department and in order to make such departments available for patients suffering from chronic rheumatic diseases some grant of funds would be necessary to increase equipment and also some arrangement to cover the cost of treatment including an adequate grant to the medical staff While in certain districts special clinics may be necessary it is desirable that these should be associated professionally with existing general hospitals

(v) *Spa Treatment*

In a certain proportion of cases spa treatment is necessary or desirable Such cases should however be selected with considerable care and approved by a suitable authority since treatment at a spa will necessarily involve greater cost than out patient treatment at a general or special hospital Three large spa hospitals (Bath Buxton and Harrogate) are available for in patient treatment and these contain 600 beds There are similar though smaller institutions at other spas

A scheme is at present in course of organization for the treatment of certain groups of insured persons as out patients at spas This may be extended to the whole group of insured persons but will not be practicable on economic and other grounds unless it is restricted to those persons who cannot be efficiently treated by other methods

(vi) *Orthopaedic Treatment*

Treatment along these lines does not differ in any material respect from treatment carried on in the orthopaedic and surgical departments of general and special hospitals Some organized provision would have to be made for the care and maintenance of those who in spite of treatment or because of lack of treatment had become permanently crippled This could be obtained by suitable arrangement with council and local authority hospitals

(vii) *Occupational Therapy*

In connexion with these hospitals and centres (especially in council and local authority hospitals) it is desirable that patients should be taught trades Each district would have to organize a social work service whether through the existing local authority organization or otherwise to follow up all patients and see that they were kept in touch with their family doctors When necessary this service could be made responsible for assembling and arranging records of each patient from the various treatment centres to which he might be sent Such service it is hoped would in time develop occupational training centres

(viii) *Central Organization*

Some central governmental departmental or other organizing body would require to accept responsibility for the general supervision of this scheme

ROYAL SALOP INFIRMARY SHREWSBURY
(150 Beds)

APPOINTMENT OF RESIDENT HOUSE PHYSICIAN

Applications are invited from fully qualified men for the appointment of Resident House Physician vacant July 1st. Salary £160 per annum with board, residence etc. The appointment is for six months in the first instance subject to re-appointment for a further period of six months. Resident Staff comprises Resident Surgical Officer House Physician and Casualty Officer and Resident Anæsthetist. The Resident House Physician is Resident Officer to the Medical Ward of the Hospital under the direction of three Honorary Physician and is also Resident Officer to the Maternity Department for difficult cases under the direction of the Honorary Obstetrician.

Application stating age qualification experience nationality and accompanied by copies of three recent testimonial to be sent to the undersigned forthwith.

Board Room J. W. NOBLE,
June 13th 1933. Secretary Supt.

WEST END HOSPITAL FOR NERVOUS DISEASES
In Patient Department Gloucester Gate Regents Park, N.W.1.
Out Patient Department 73 Welbeck St. W.1

The Committee of Management invites applications for the post of HONORARY ASSISTANT OPHTHALMIC SURGEON. The date by which applications must be received has been extended to Monday July 10th. Candidates who must be Fellows of the Royal College of Surgeons of England are requested to send eleven copies of their application with recent testimonials by *July 10th to the undersigned* from whom further particulars should be obtained.

J. P. WETENHALL,
Welbeck Street W.1. Secretary.

THE GLOUCESTERSHIRE ROYAL INFIRMARY AND EYE INSTITUTION
(216 Beds.)

TWO HOUSE SURGEONS (male) fully qualified. Salary £150 per annum with *board residence and laundry*.

The appointments are for six months which may be extended for similar periods by re-election from time to time.

Applications stating age qualification and nationality with copies of not less than three recent testimonials should be sent to the undersigned not later than June 29th.

The elected candidates will be required to enter upon their duties on July 17th.

F. J. SYMONS,
June 15th, 1933. Secretary.

ST MARY'S HOSPITAL, W.2.

SURGICAL REGISTRAR.

The Board of Management invite applications for the above post. Candidates for the appointment must be registered Medical Practitioners and Fellows or Members of the Royal College of Surgeons of England or Graduates in Surgery of a University in the British Empire.

The salary is £200 per annum with luncheon and tea. Copies of the regulations for the Surgical Registrar may be obtained on application to the Secretary's Office.

Application with copies of testimonials not exceeding three in number should reach the undersigned on or before Wednesday June 28th.

W. PARKES Secretary.

HOUSE SURGEON required, July 15th. Good general surgical work. Commencing salary at rate of £150 p.a., plus usual. Six months' appointment. Apply, with copies of testimonials to the Secretary at the Hospital.

XII OBSERVATIONS ON ADVERTISED REMEDIES

The attention of the Committee has been called to the volume and character of the traffic in proprietary remedies and unqualified treatment for the various conditions falling within its reference, and in particular to the use which advertisers make of medical opinion

The Committee considers that the false and misleading statements so widely circulated through the medium of advertisements constitute a material obstacle to the general application of effective measures of treatment, and that, owing to the time wasted in trying these so-called remedies, the disease in many cases may not only be aggravated, but may also pass from a curable into an incurable stage The Committee desires in this connexion to emphasize the need for legislation for the control of the traffic in proprietary remedies and the provision of efficient administrative machinery to enforce such control Meanwhile, members of the profession will be well advised to exercise the greatest care to prevent any expression or misrepresentation of their opinions being used to support the exaggerated claims of the vendors of proprietary articles

XIII INDICATIONS FOR FUTURE RESEARCH

Incidence It is desirable to determine the distribution of the arthritic conditions dealt with in this report (*a*) in the country as a whole, (*b*) in various trades and occupations, and (*c*) in various localities and under different climatic conditions

Bacteriology According to some authorities the pathological conditions which exist in arthritis are due to direct invasion of the joint tissues by micro organisms Opposed to this view is the claim that such changes are due to the sensitization of the tissues by toxins derived from bacterial foci in some other part of the body It would be desirable to determine the relative importance of these two agencies It has been claimed by some and denied by others that it is possible to reproduce in animals arthritic lesions identical with those present in the arthritis of man Confirmation on this point is necessary

The nature and strain of the micro-organisms responsible directly or indirectly for arthritic changes, and the extent to which they may be isolated from the tissues and body fluids, await determination To settle these questions the closest co-operation between clinicians and bacteriologists is necessary The most up to date equipment in the laboratory, and the provision of special research beds in hospitals, is a prerequisite to success, and many experiments will have to be repeated and subjected to the most rigid controls Much of this work can probably be done only in specially equipped hospitals and by specially skilled observers who are able to continue their investigations over a considerable period of time

Biochemistry The general nature of the sedimentation rate test still awaits elucidation and the recognized discrepancy between an improved condition of the patient on the one hand and the delayed return to a normal blood sedimentation rate on the other requires investigation

The following investigations would appear to be important in relation to arthritis and allied conditions (1) calcium metabolism, (2) liver function, (3) the presence of (*a*) haemolysins, (*b*) glutathione in the blood, and (4) skin reactions and allergic manifestations

Clinical Features Co operation between clinicians, radiologists, morbid anatomists, and comparative pathologists is necessary to determine a correspondence between their several findings, so that an agreed classification of arthritic diseases may be obtained

Treatment Controlled experiments are needed to determine the value of the numerous therapeutic methods advised for the treatment of the various forms of arthritis

XIV SUGGESTIONS FOR FURTHER PROFESSIONAL EDUCATION

The Committee inquired from the deans of medical schools if there is any provision, apart from the ordinary routine teaching in medicine, for instruction in the early diagnosis, prevention, and treatment of chronic arthritis and allied conditions A few schools provide special facilities for the study of these subjects, but the majority replied that they were adequately dealt with in the routine instruction in medicine and surgery

The present arrangements should be supplemented by demonstrations in municipal hospitals of clinical cases which illustrate both the various stages and the end results of arthritis, and by demonstrations at adjacent spas and clinics, both of cases and of hydrological and physical methods of treatment

It is clear that most special instruction must be post graduate It is suggested that for this purpose the three spa hospitals (Bath Buxton, Harrogate) and the Red Cross Clinic, London, should be asked to collaborate in the preparation of cinematograph films, lantern slides, and casts, for the purpose of illustrating the diagnosis and treatment of arthritis and allied conditions When this material is complete the Divisions and Branches of the British Medical Association should be informed that lecture demonstrations on this subject can be secured through the Medical Department of the Association A panel of lecturers could no doubt be arranged

Memoranda

MEDICAL, SURGICAL, OBSTETRICAL

APPENDICITIS AND MECKEL'S DIVERTICULUM

In view of the article on Meckel's Diverticulum and Appendicitis published in the *Journal* of June 3rd the following case may be of interest

J. N. aged 17 was admitted with a diagnosis of acute appendicitis. He complained of abdominal pain of ten hours' duration starting in the region of the umbilicus and settling in the right iliac fossa. He had vomited once soon after the onset and there was no history of constipation. His temperature was 96·6° F. pulse 60. Examination of the abdomen revealed nothing more than tenderness in the right iliac fossa. There was a history of a similar attack lasting a few days five years previously.

On opening the abdomen by Battle's incision the cavity was found to contain some free fluid of a clear watery nature. The appendix apart from some kinking and thickening showed no gross pathological change but the caecum was ensnared and partially obstructed by a Meckel's diverticulum. This was four to five inches in length and was adherent by its extremity to the abdominal wall at the umbilicus. The caecum was uninjured.

Appendix and diverticulum were both excised and the abdomen was closed without drainage. Convalescence was normal the patient being discharged seventeen days after operation.

G. A. WEIR, M.B., Ch.B.
House Surgeon, Royal Victoria Hospital, Dover.

LUTEAL EXTRACT FOR MAINTENANCE OF PREGNANCY

In view of the work done by Pfiffner and Harris [1] Allen and Corner [2] and others on the maintenance of pregnancy in castrated laboratory animals the following case in a human being should prove of interest.

The patient who had had a posterior division of the cervix performed in 1924 and curettage with removal of a pedunculated growth in 1927 became pregnant on three occasions after the last mentioned date. During each pregnancy her health was very bad. Nausea vomiting gastric pain pain in the back nervous irritability pallor emaciation and weakness were all marked. Menstrual flow continued in each pregnancy for the first one or two periods and at each subsequent period a pink colour was noted in the discharge. Each pregnancy terminated about the twenty-second week. The patient had fallen about three weeks before the first miscarriage. There was no known possible external cause in the two subsequent miscarriages. The babies were all born alive. The posterior division of the cervix had been closed after the third miscarriage.

In the fourth pregnancy (January 1932) similar conditions of ill health obtained and the patient was virtually confined to bed. All the usual medical physical and psychical treatments were applied to no purpose.

Treatment by injections of luteal extract (prepared by Messrs. Armour) was started when during the fourth month the patient noticed distinct bleeding at a period and felt as if she were going to miscarry. One cubic centimetre of the extract was injected twice weekly. The digestive system settled down in a few days and the patient was perfectly healthy and physically strong in five weeks. Two doses weekly proved sufficient. A delay of a few days in the administration of the extract on a few occasions caused a recurrence of the symptoms of ill health which again disappeared when the injections recommenced. Injections were stopped at what was believed to be about one fortnight prior to the end of the gestation period to avoid possible overcarry or inhibition of uterine contractions [3]. Five days after the last injection the membranes ruptured and the patient went into labour two days later in hospital. The baby though distressed survived.

The continuance of the menstrual flow and the failure to maintain the pregnancies suggested some deficiency of the luteal hormones. The cessation of the flow and the maintenance of the fourth pregnancy to term with restoration of the health to a normal condition tend strongly to confirm this. I do not think the closure of the posterior cervical division had much to do with the maintenance of the fourth pregnancy as the condition of the patient prior to the use of the extract was worse during the fourth pregnancy than ever before.

R. G. Harris in a personal communication recently received suggests that theelin should be given for the last fortnight of term in cases where luteal extract is used so as to avoid any possible interference with labour.

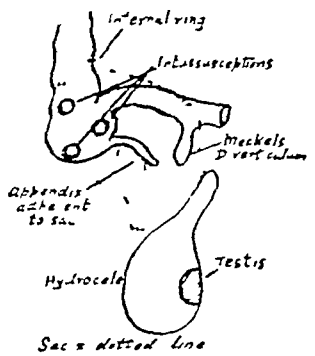
UNUSUAL CASE OF STRANGULATED HERNIA

The following is a record of a case of strangulated hernia that occurred in Bethlem Royal Hospital and which bears very unusual features.

A man aged 65 was admitted on October 21st 1931 suffering from involutional melancholia. On admission he had a hydrocele of the left tunica vaginalis and a right inguinal hernia. The hydrocele was tapped in December and 16 oz. of fluid withdrawn. No active treatment was considered necessary for the hernia since it was easily reducible and the patient's mental condition necessitated almost total confinement to bed.

The hydrocele gradually enlarged again and in January 1932 the scrotum was about the size of two clenched fists



but quite flabby. On the afternoon of January 25th 1933 the patient was allowed out of bed but shortly after rising doubled up and began to groan. Subjective symptoms were valueless owing to the mental condition but on examination the scrotum was found to have increased in size and to be quite tense. In the scrotum besides the hydrocele there was a large swelling situated above it this was irreducible and tender and was considered to be a strangulated hernia. A firm constriction was palpable in it just above Poupart's ligament. The temperature and pulse were quite normal. The patient had vomited a few times during the previous month but on several such occasions he was observed to induce it by tickling the throat.

Mr. Stanford Cade saw the patient that evening diagnosed a strangulated hernia and proceeded to operate at once. On opening the hernial sac the following structures were found within it: (1) The major part of the caecum in the wall of which were three small early-stage intussusceptions the diameter of each was about 3/4 inch and the depth about 1 inch. (2) The vermiform appendix which was adherent to

GEORGE WATTS,
June 6th, 1933. Secretary Supt.

(Appointments continued on p. 50)

the posterior wall of the sac (3) A portion of the ileum about 6 inches from the ileo-cæcal junction with a Meckel's diverticulum measuring about 2 inches in length The appendix was freed from the sac and removed the remaining structures returned to the abdominal cavity and the tunica vaginalis everted The patient's convalescence has been rapid and uneventful

I wish to thank Dr Porter Phillips and Mr Stanford Cade for their kind permission to publish this case

Beckenham OTHO FITZGERALD

THE ELASTICITY OF THE SKIN

I am induced to report the following case because I would have thought such an injury impossible with an intact skin

A boy 13½ years of age jumped on a fence in search of a cricket ball that went into a neighbouring garden He either slipped or fell into the garden in which there was a three-quarter inch water pipe used as a garden stake He struck this pipe an inch within the nipple line at the fourth left costal cartilage He died in a few moments The mark of the circle of the top of the pipe could just be seen in the upper part and in the lower part it had slightly abraded the skin There was no wound and no mark on the skin when reflected His pectoral and intercostal muscle were torn making an opening between the fourth and fifth cartilages but did not fracture or tear either The opening was so made for two inches that the pericardium could be seen and was intact though distended with blood and blood clot There was a tear in the left ventricle which admitted the end of my thumb and was immediately to the left of the interventricular septum

Sydney STRATFORD SHELDON, M B Ch M

Reports of Societies

SURGICAL TREATMENT OF DUODENAL ULCER

At a meeting of the Aberdeen Medico-Chirurgical Society on June 1st with the president, Dr W CLARK SOUTER in the chair a discussion on the surgical treatment of duodenal ulcer was opened by Mr ALEXANDER MITCHELL

Mr Mitchell based his observations on the records of about 144 cases operated upon by Mr F K Smith and himself during the period 1926–31 The great majority had been males and in these the age incidence at the time surgical treatment had been instituted was much earlier than among females It was generally accepted that unless there was definite evidence of pyloric stenosis, medical treatment should be tried first, but the question as to when the patient should be handed over to the surgeon was difficult and one on which there was no general agreement The modern surgical treatment of duodenal ulcer resolved itself into the choice of four types of operation—namely gastro-enterostomy, excision of the ulcer with some form of pyloroplasty, excision of more than half of the pylorus without opening the duodenum or stomach and excision of the pyloric end of the stomach to diminish acidity Excision and pyloroplasty were applicable only when the duodenum was fairly free, and preferably in the case of an anterior ulcer, when successfully performed however this operation did all that gastro-enterostomy did without the risk of the undesirable sequels especially associated with gastro-enterostomy Mr Mitchell emphasized the necessity in all types of operation of careful examination of the abdomen and of dealing with any abnormal condition, especially of the gall-bladder and appendix Of 114 cases treated by gastro-enterostomy there were eighty-seven good results, fourteen fair nine bad and four deaths, of the twenty-eight cases treated by excision and pyloroplasty eighteen results were good eight fair and one bad while one patient had died of post-operative pneumonia In one case appendicectomy only had produced a good result Gastro-enterostomy was evidently a satisfactory operation in certain cases but there were risks of undesirable sequels, such as anastomotic ulcer, bilious vomiting kinking of the jejunum and haemorrhage Mr Mitchell had been unable to reach a definite finding as to the relation between the duration of symptoms and the age of the patient and the final result, except that better results were obtained in cases with a long history in which very definite pyloric stenosis had been present The after-treatment and the duration of subsequent medical supervision also influenced the final result Mr Mitchell was of opinion that gastric hyperacidity was lessened as well by pyloroplasty as by gastro-enterostomy It was impossible to compare accurately the risks of surgical as opposed to medical treatment, and in surgical failures it could not be said whether one was dealing with failure to cure the original ulcer or with the development of a new ulcer from an inherent predisposition to ulcer

Mr F K SMITH congratulated Mr Mitchell on his study He found the preponderance in males and earlier age incidence very interesting Among possible aetiological factors he mentioned Müller's theory of a vaso-neurotic state or sympathetic derangement He thought Mr Mitchell's results exceedingly good Absolute indications for surgical treatment were perforation and pyloric stenosis Mr Smith was inclined to disagree with Mr Mitchell as to the frequency of anastomotic ulcer especially as this condition was very difficult to diagnose correctly secondary ulceration very seldom occurred if the gastro-enterostomy opening was made towards the pyloric end of the stomach Care had to be taken with materials method of suturing and sufficient size of opening, the latter to be at least twice the diameter of the part of the jejunum to be anastomosed The gastric acidity was sometimes higher after gastro-enterostomy or even after gastro-duodenostomy than before operation Mr Smith considered the good results in many cases due to resting of the affected parts Poor operative results were obtained in recurrent haemorrhagic ulcers, and it was doubtful whether the bleeding always came from an ulcer, either duodenal or anastomotic

Dr H MCGILL stated that in experimental feeding the impaction of faeces in the cæcum with cæcal ulcers was associated with bleeding points in the stomach and other parts of the gut in the neighbourhood of the pyloric sphincter spasm of which was caused by excessive stimuli from the distal portion of the intestine If the concentration of food were greater than the optimum solution for absorption intense congestion of the duodenum occurred, while the rate of emptying of the stomach was in direct relation to the concentration of the solution

Mr G H COTT stated that there were industrial reasons for surgical treatment as some patients could not obtain appropriate diet The preponderance of males found by Mr Mitchell was not general in the country Perforation cured the ulcer in 90 per cent of cases if the ulcer was anterior and in the first part of the duodenum, and in 50 per cent if the ulcer was far down and posterior In performing gastro-enterostomy the tension of the loop was the important point

Dr A GRANT ANDERSON quoted the findings of Matthew Stewart of Leeds that in all post-mortems he had performed a duodenal ulcer or the scar of an ulcer was found in 10 per cent Mentioning that out of 100 medical students ten would show a hyperchlorhydria, he stated that a definite ulcer diathesis existed, and that recurrence of symptoms might be due to the gastritis A five-year period was necessary for the proper assessment of treatment either medical or surgical and the good results were not so frequent as had been made out On the five-year period basis the figures from the Charité Clinic in Berlin showed 50 per cent bad results from gastro-enterostomy, figures from other centres were much the same The ulcer might not heal, and there was the possibility of a gastro-jejunal ulcer Partial gastrectomy was preferable Berg's experience showed a 5 per cent mortality figures for bad results (recurrence of symptoms) were 16 per cent for gastro-enterostomy and 2 per cent for gastrectomy The acid factor must be an important

one and gastro-enterostomy was not likely to lead to achlorhydria

Professor L S P DAVIDSON thought that most acute and chronic ulcers if the history was not too long healed spontaneously if given a chance Dr J E SKINNER had found women more amenable to treatment than men A factor which he had found retarded recovery every time it occurred was constipation

THE PRESACRAL NERVE

At a meeting of the North of England Obstetrical and Gynaecological Society held at Leeds on April 28th with the president Mr LEYLAND ROBINSON in the chair Mr A A DAVIS read a paper on the presacral nerve Mr Davis described in detail from the findings in over seventy dissections the anatomy of the so-called presacral sympathetic nerve He showed the varied forms found—from the rare single nerve to the more usual plexus In defining the relations of this plexus he pointed out that sometimes the pelvic mesocolon with its contained vessels transgressed the midline and so came to form a direct anterior relation of the plexus—a point of surgical importance Discussing briefly the physiology of the plexus he mentioned the following important facts One third of the fibres were centripetal the nerve being in fact viscero-sensitive Section of the presacral nerve relieved pain in the pelvic viscera Painless precipitate labour had followed resection in a case of Dr Addis s Increased frequency and ease of emptying of the bladder and rectum followed resection Resection of the presacral nerve appeared to be harmless to all pelvic functions Mr Davis described the operation by Cotte and Leriche and showed the collected results to date He concluded by claiming for the operation a definite sphere of application and as indications for the operation he gave the following (1) severe dysmenorrhoea which has not reacted to medicinal and minor surgical procedures (2) severe intractable pelvic neuralgias especially of inoperable pelvic carcinoma (3) intractable pruritus vulvae and ani (4) as a corollary to other operative procedures in cases of long standing pelvic pain

Treatment of Hydrocephalus

Dr C H WALSH described a new method of treatment of hydrocephalus which he had employed in two cases recently In each case the hydrocephalus was marked and typical and the diagnosis was confirmed by radiography In both cases there was primary inertia and early rupture of the membranes At the time of treatment—in one case fifty four hours following rupture of the membranes—there was only slight dilatation of the cervix In each case the bladder was emptied and the hydrocephalic head was tapped of its cerebro-spinal fluid by plunging a lumbar puncture needle through the abdominal wall and uterus at a point equidistant from the symphysis pubis and umbilicus Local anaesthesia was used Radiographs before and after tappings were shown In one case delivery was spontaneous In the other case delivery had to be assisted Dr Walsh claimed that this was an easy safe and clean method of treatment of hydrocephalus when the head presented Mrs D W CURRIE described a case of rupture in which auto-transfusion of the blood recovered from the abdomen was performed with good results Mr A M CLAYE in a note on the induction of the menopause by radium described a series of cases he had treated with excellent results Mrs CLAYE stressed the use of correct dosage of radium

Reviews

CHRONIC RHEUMATIC DISEASES

Dr B L WYATT runs a clinic for the treatment of chronic arthritis and his recent volume[1] is based on a detailed study of 400 cases which have received treatment at that clinic The result is a very valuable work but as with many American books the author s own opinions and conclusions are often overlaid and obscured by a mass of observations and statistics culled from the literature with great erudition and labour For example the first section on nomenclature pathology and aetiology only serves to show how many conflicting data can be found on this subject and how little exact knowledge we possess The author is very much wedded to the infective theory and in this most people will find themselves in agreement but when dealing with metabolic factors he confines himself entirely to a consideration of gout There are several authorities in this country who would extend this view considerably and would regard chronic villous arthritis and many cases of fibrositis and osteo-arthritis as of primarily metabolic origin It would seem that theories both of causation and of treatment are largely determined by the locality and circumstances of the practising physicians Thus it is noticeable that those who practise in spas naturally uphold the efficacy of hydrotherapy and in view of the marked metabolic influence of this form of treatment they are apt to claim an extended field for the aetiological importance of metabolic changes Those who practise in the larger cities on the other hand are found to insist on an almost exclusively infective origin and pin their faith on the therapeutic virtues of vaccines and the simple forms of physical therapy This is somewhat naively brought out by Dr Wyatt who writes

> Thermal effects may be produced by hydrotherapy electrical modalities and other means For the average suite of medical offices hydrotherapy is not readily available and reference to the section dealing with the therapeutic adjunct shows that it has well-defined limitations and is only of special value in a comparatively small number of cases

Compare this with the opinions of perfectly honest spa physicians and the rank and file of the medical profession may well ask what they are to believe The chief merits of this book are that the serious social menace of arthritis is well presented and that it is recognized that

> chronic arthritis is not a disease but rather a group of diseases which differ both aetiologically and pathologically It therefore should be apparent why a panacea for these various ills does not exist It is highly probable that as our knowledge increases medical science will make many important contributions to the treatment of chronic joint disease but it is by no means necessary to await these developments the treatment of chronic arthritis must be assumed by the general practitioner if the present toll of suffering is to be markedly curtailed and the problems of differential diagnosis and composite therapy do not present unsurmountable obstacles to the average careful and conscientious clinician

Dr Wyatt rightly stresses the necessity of composite treatment comprising (1) attention to the general strength and resistance of the patient by diet sunlight and fresh air adapted to the needs of the individual patients (2) removal of sources of infection (3) treatment thereof by suitable vaccines though he recommends larger doses than would be approved by many English authorities (4) heat and (5) massage the latter of which he regards as of especial importance and utility This book is certainly to be recommended to all those interested in chronic rheumatic diseases

W T SOUTHWOOD Superintendent & Secretary

Dr HINDLEY-SMITH'S book *Chronic Rheumatism and the Pre-rheumatic State*[2] is one which we cannot recommend It seems to be retrograde in every respect, since no clinical distinction is drawn between the various types of acute and chronic rheumatism The author claims that every form of these is a stage of the same disease, because it is the result of a pharyngeal infection with a streptococcus This leads to the conclusion—no doubt comfortable to the author—that he can prevent and even cure all sorts and conditions of chronic rheumatism by his own special regime which is characterized by the administration of large doses of vaccine and the application of ultraviolet rays Practitioners with any sort of experience in dealing with this complex group of diseases know only too well that we are still far from knowing all, or even much, about their aetiology , that treatment is difficult and all too often disappointing , and that there is no sovereign remedy for this any more than for any other group of diseases which appear to have a superficial resemblance to each other Such books are apt to mislead the profession and raise false hopes among the public, which it may take some years to prove to be unfounded

FOOD AND DIETETICS

Dr ROBERT HUTCHISON S *Food and the Principles of Dietetics*[3] made its bow in 1900, and in the succeeding quarter of a century the author produced six editions singlehanded , but for the production of the seventh edition, which was published a month or two ago he obtained the assistance of Professor V H MOTTRAM This textbook has been a standard work for thirty-two years, and its merits are so well known to our profession that it is superfluous to say anything about its general character Founded upon a course of lectures to medical students at the London Hospital, it quickly met with favour among a far wider audience who already knew of Dr Hutchison s gifts as a clinical lecturer The new edition has been extensively revised In particular the first three chapters have been completely rewritten, and for this Professor Mottram is responsible chiefly Among other points it may be noted that the prices given in the tables and plates have all been revised and brought up to the scale of modern costs The general form and scope of the book has, however, been left unaltered and there is every reason to believe that the new edition will maintain the well-earned popularity and prestige of its predecessors It appears at a time when foods and dietaries in health and disease are attracting more general interest than ever before

REACTION OF TISSUES TO ENVIRONMENT

In a small volume entitled *L'État Réactionnel*[4] Professor GUIEYSSE PELLISSIER discusses the problem of tissue reaction occurring within the limits of health, resulting from variations in the environment The relationship is obvious in many cases, as in the pigmentation of the skin in tropical countries and the alteration of the blood in high altitudes In some instances, however, the change in the environment escapes detection, and the tissue reaction is apt to be regarded as pathological Cases of this kind seem to occupy an intermediate position between the normal and the pathological, and the author uses the term ' reactional state " to indicate this he has studied the subject more especially in connexion with the lymphatic tissue, which is peculiarly sensitive to alterations in the environment Hyperplasia of this tissue of a purely reactional nature is very readily mistaken for a pathological change The author adduces many examples If rats are reared in cages furnished with a floor of putrid horse dung they remain in perfect health but their lung tissue is found to be loaded with enormous accumulations of lymphocytes, which might be taken to indicate an inflammatory reaction, but are unaccompanied by fibrosis and other definite signs of inflammation Experiments with mild inhalations of formol and turpentine gave similar results in dogs The author has also made a large number of observations on the variation in the amount of lymphatic tissue in the gills of fish which are very suitable for the study of the effect of alterations in the environment He has observed that the gills of river fish always contain lymphatic tissue in greater abundance than sea fish , and with regard to river fish a greater increase in lymphatic tissue is found in those living in water polluted with sewage

The author looks on the above examples as instances of physiological reaction , although overstepping the normal they are not regarded as pathological, and he places them in his reactional category The subject is interesting in its bearing on the question of the significance of such conditions as hypertrophy of the tonsils in children and the accumulations of lymphatic tissue that are common in the vermiform appendix, which the author regards as merely reactional Although not in themselves pathological, the lymphatic accumulations may cause damage to the tissues in which they occur In the case of the tonsil, for example, the lymphocytes infiltrate the overlying epithelium, destroying it in places, and thus creating gaps which may facilitate the entry of microbes The first half of the book is devoted to a valuable description of the various types of lymphatic tissue and their distribution in the body

THE LIVING CELL

In a volume entitled *The Action of the Living Cell*[5] Dr FENTON B TURCK has published the main results of his experimental work on problems related to cell metabolism This work he has carried on for some forty years, and during this period the results have been communicated to various medical journals Perhaps the most important of Dr Turck's observations has been the demonstration of the relation between injured tissues and shock and the toxic nature of most of the manifestations of this condition In this matter Dr Turck's work was undoubtedly pioneer , the acceptance of his conclusions was long delayed, but they are now, in general, regarded as correct Dr Turck subsequently showed that as a result of injury, such as simple trauma or burn, a process of autolysis occurred in the damaged tissue cells, and that to the absorption of the autolytic products were due the major phenomena of shock Since these experiments he has extended his researches on the nature and effect of autolytic products in various directions He has been unable, even with the aid of expert chemical assistance, to define the chemical nature of the toxic products with which he has worked, but has adopted the designation "cytost" for these products According to his views "cytost" may be produced by any form of injury—mechanical, irritant or bacterial—also by fatigue and by a great variety of other influences On the evidence he does not appear to be entitled to assume, as he does

---

Chronic Rheumatism and the Pre rheumatic State By J D Hindley Smith M A M R C S London H K Lewis and Co, Ltd 1932 (Pp 154 5s 6d)

[3] *Food and the Principles of Dietetics* By R Hutchison M D, F R C P and V H Mottram M A Seventh edition London E Arnold and Co 1933 (Pp xvi + 630 illustrated 21s net)

[4] *L État Réactionnel* Par Professeur A Guieysse Pellissier Paris Libraire Felix Alcan 1932 (Pp 224 54 figures 20 fr)

[5] *The Action of the Living Cell* Experimental Researches in Biology By Fenton B Turck New York The Macmillan Company 1933 (Pp x + 308 17 figures 18s net)

that a single toxic product results from the action of these various influences on cells of all kinds He expects that many of his deductions and concepts will meet the opposition usually accorded new theories with the logic of some of his arguments fault must be found but there can be no doubt that the experimental work he records breaks new ground in directions which seem well worth following

PSYCHOLOGY AND PSYCHOPATHOLOGY

A Psychologist's Point of View[1] by Dr CHARLES S MYERS contains twelve semi popular essays covering a wide range of topics of general interest The book opens with an essay on Human Improvability which reveals a note of hopefulness and optimism characteristic of the author's outlook on life Three of the papers are concerned respectively with industrial psychology education and vocations and hindrances to output these being practical problems to which Dr Myers has given much attention during the last few years On the anthropological side we find two interesting chapters on The Taste names of Primitive People and The Beginnings of Music This eminently readable book also includes chapters on such widely differing problems as Success Prayer Freudian Psychology and Instinct and Intelligence

Psychopathologists will welcome the publication of a relatively small book on *Psychology of Sex*[2] by Dr HAVELOCK ELLIS This book will meet a need since the monumental volumes on sex and its morbid deviations by the same author deal too exhaustively with the subject to be of practical value to the busy practitioner This smaller volume would appear to provide exactly the amount of knowledge required by the physician when confronted with the not inconsiderable number of patients who are the subjects of sexual difficulties or perversions In his introduction to this volume Dr Havelock Ellis observes that again and again where sexual anomalies are concerned patients complain that the practitioner has shown no comprehension of their sexual difficulties or peculiarities either brushing them aside or treating them as vicious Furthermore the author suggests it is doubtless the patient's consciousness of this attitude in his doctor which leads many physicians to declare that psycho-sexual anomalies are very rare and that they scarcely ever meet with them It would appear to be most desirable that instruction on this subject should be imparted to senior medical students and this volume might suitably be utilized as a textbook since it would seem adequately to convey the information necessary to help those patients who complain of sexual difficulties

Psycho-Analysis and its Derivatives[3] by Dr H CRICHTON MILLER is a useful addition to the Home University Library series It is the aim of the author to study psycho-analysis and the other schools of psychopathology from an external and impartial point of view and in the course of this book he gives a critical survey of Freud's formulations together with those of Jung and Adler The book is lucid in style and may safely be recommended to those who wish to acquaint themselves with the formulations of the three leading schools of psychopathology In a concluding chapter an account is given of the work of Prinzhorn whose book on psychotherapy was recently reviewed in our columns

Medical Pamphlet No 6 of the Individual Psychology Publications includes an interesting communication by Dr Erwin Wexberg one of the leaders of the Adlerian movement The subject of this address is *Individual Psychology and Practice*[4] Also included in this pamphlet is a translation of a paper by Dr Olga Knopf on individual psychology and gynaecology the purpose of which is to show that psychical illness can appear in the garb of an organic disturbance This and the earlier publications of the same series will be found helpful to the medical practitioner

INTERNAL DERANGEMENTS OF THE KNEE

The good opinion which we expressed nine years ago in our review of the first edition of Mr TIMBRELL FISHER'S monograph on *Internal Derangements of the Knee-Joint*[5] is fortified and extended on perusal of the second This is not merely a reprint but a much enlarged and amplified work embodying a great deal of additional matter and enriched by the experience acquired during the interval It is half as large again as the first edition and contains a proportionately larger number of illustrations As the author points out, the subject was little considered on the Continent until recent years but has attracted a great amount of attention lately with the result that knowledge of it has increased Cyst of a semilunar cartilage is cited by the author as a case in point Between 1904 and 1914 only five cases were on record in surgical literature The next ten years produced nineteen more while in the succeeding eight years at least eighty two further cases have been described This extension of knowledge is largely due to Mr Fisher's work and publications on all forms of derangement of the knee-joint The records of after results of treatment which he gives in this volume are of interest and value The notes on various cases and conditions contributed by the late Sir Robert Jones and printed as an appendix are of great value and have a pathetic interest for as Mr Fisher points out they are probably the last surgical writings from the pen of that gifted and beloved orthopaedic surgeon

The advice as to modes of approach to the interior of the knee-joint is sound and we agree with Mr Fisher in regretting that Continental surgeons especially French should advocate incisions which involve a quite unnecessary division of the lateral ligament. Good exposure of the joint and consequent complete removal of the offending cartilage are desiderata of great importance In this respect the author has modified the opinion expressed in the first edition for which he gives convincing arguments In some cases in which it is difficult to be sure that the whole cartilage is removed through the usual anterior incision a modification of Allwyn Smith's combined anterior and posterior incisions is recommended So far from admitting that removal of a semilunar cartilage predisposes to subsequent arthritis Mr Fisher quotes with approval the dictum that a successful operation upon the injured semilunar cartilage is the safest insurance against later arthritis

We think that this monograph may be accepted as the leading and surest guide to this important subject

Notes on Books

Mr E W HEY GROVES's illustrated *Synopsis of Surgery*[11] has now passed into a tenth edition, its predecessor appeared in 1930 This popular compendium has been revised and brought up to date, involving the rewriting of the sections on radium treatment of malignant disease, on the surgery of the sympathetic nervous system, and on the vaseline pack method (Winnett-Orr) of treating septic bone conditions A new chapter outlining the principles governing amputations has been added In this it is mentioned that the art of making artificial limbs has so greatly improved that it is now the case that only those types of amputation after which an artificial limb can be fitted are worth while The book is a highly condensed, but thoroughly practical, survey of the whole field of modern surgery

Principles of Pharmacy,[12] by H B MACKIE, is a textbook designed for students training for examinations in this subject, and is based on the lecture course given by the author at Brighton Technical College The distinctive feature of the work is that he endeavours to explain pharmaceutical methods in terms of physical chemistry The methods of pharmaceutical chemistry were evolved by empirical practice, but any attempt at their theoretical explanation calls for a discussion of difficult and obscure problems in physical chemistry Among the subjects chosen by Mr Mackie for his lessons are the laws of adsorption, the physical chemistry of emulsions, the properties of colloidal solutions, and the mechanism of enzyme action These and many other problems are touched on

Mr JAMES KEMBLE has produced a pleasant little book which he calls *Idols and Invalids*,[13] as a result of browsing in some byways of medical history The essays follow no chronological order, for the first deals with Byron, the last with Queen Anne He includes in his purview Columbus, Judge Jeffreys, Louis XV, the Borgias, Cleopatra, Nelson, and Henry VIII He makes no pretence of original research, but shows evidence of wide reading and a cultured mind He advances sane and plausible reasons for the views he advocates, although some of them are at variance with opinions generally received as to the illnesses of the persons he writes about He throws light upon many conditions that have puzzled previous writers for he has a sound knowledge of modern medicine The book ends on a deep note of pessimism, but in spite of this it serves to pass an idle hour both for the lay and for the medical reader

Whitla's Pharmacy, Materia Medica and Therapeutics[14] was first published in 1881, and during the next forty years eleven editions were prepared under the personal and sole supervision of Sir William Whitla The present edition has been revised by Professor J A GUNN, who has made the alterations necessitated by the appearance of the new *British Pharmacopoeia*, but has avoided alterations in the general form of the work, thus preserving its original scope and character The first two parts are devoted to pharmacy and prescription writing, and this is followed by an account of the materia medica of the *B P* These together occupy nearly half the volume In Part IV the therapeutic properties of the official remedies are treated in alphabetical order, and the accounts contain many interesting observations based on the clinical experience of the original author Part V deals with a selected list of non official remedies, and here the pharmaceutical properties and the therapeutic actions of the drugs are described together The volume concludes with an index of poisons and their antidotes This summary indicates the general scope of the text, which as its title shows, is mainly concerned with the pharmaceutical properties and the therapeutic application of drugs

In a number largely devoted to rheumatic diseases it is appropriate to mention two books received during the past few days *Rheumatismus und Grenzgebiete* by Dr ANTON FISCHER of Aachen (Berlin Julius Springer), and a second edition of Dr A H DOUTHWAITE's *Treatment of Rheumatoid Arthritis and Sciatica* (London H K Lewis and Co), which was favourably noticed in these columns in 1929

[11] *A Synopsis of Surgery* By E W Hey Groves M S M D Tenth edition Bristol J Wright and Sons Ltd 1933 (Pp viii + 693 13 plates 164 figures 17s 6d net)

[12] *Principles of Pharmacy* By H B Mackie B Pharm Ph C London J and A Churchill 1932 (Pp 281 67 figures 10s 6d)

[13] *Idols and Invalids* By J Kemble Ch M F R C S London Methuen and Co, Ltd 1933 (Pp 212 6s net)

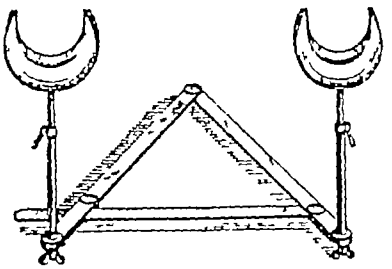
[14] *Whitla's Pharmacy Materia Medica and Therapeutics* Revised by J A Gunn, M A M D D Sc F R C P Assisted by H Berry, B Sc and J Clifford Hoyle M D Twelfth edition London Baillière Tindall and Cox 1933 (Pp xii + 645 16 figures 12s 6d)

Preparations and Appliances

PORTABLE LITHOTOMY SUPPORT

Dr SHEILA MACPHERSON (Invergowrie, Perthshire) writes The portable lithotomy support shown in the accompanying illustration has been designed for me by Miss Alix Crichton It has proved so useful in obstetrical operations performed in the patient's own home that I should like to draw the attention of the medical profession to its advantages

The appliance comprises a base and leg supports The base is a flat triangle adjustable to give any width of abduction of the legs It is placed under the mattress of a bed or under a folded blanket on a table The leg rests



fit into sockets which project beyond the angles of the base and which telescope to the required height, while the crutch tops detachable for cleaning are specially designed to obviate harmful pressure on the popliteal structures The apparatus is sufficiently stable to remain in position even during the strongest pull in difficult instrumental delivery It retains the patient without the aid of an assistant so that the single handed practitioner even in the most adverse circumstances may be afforded the optimum accessibility to the parts for delivery, perineal repair and antiseptic and aseptic work The whole appliance folds neatly into a case for carrying It is made by Messrs Adnatt and Partners Walmer House, Regent Street W 1

AN ELECTRO MAGNETIC EXTRACTOR

Magnets for the removal of foreign bodies of iron or steel from the eye have been in use for many years Rod magnets have had their field of action which is by no means to be despised while the more powerful electro magnets have done good service for close on fifty years It must be nearly that time since Snell of Sheffield introduced his convenient hand form of electro magnet and it is fully half that time since Haab devised his giant magnet Something of the usefulness of these magnets has passed since the introduction of non magnetic steels for the making of fine tools But for all other works where iron is used in manufacture there is value in the provision of a hand electro magnet for the service of the works doctor or nurse Messrs Frank Moss and Co of 25 Warwick Road, Coventry have put on the market a useful form of electro-magnet which is as portable as an electric ophthalmoscope and can be energized by attachment of a dry battery or accumulator of 2 to 6 volt capacity It is stated that the drawing power of the magnet averages from 4 to 10 ounces The specimen tested showed a pull of 4 ounces That is ample for the removal of foreign bodies from the eye Indeed a more powerful pull might be dangerous, since it might tempt the unwary to extract fragments that had penetrated the cornea Such cases should only be dealt with in hospital The magnet under examination is well made, the end of the applicator is blunt so is not likely to be dangerous, and the cost (35s in case post free) is comparatively small

ARTHRITIS IN THE SPA HOSPITALS

The spa hospitals have a long and honourable record for the treatment of rheumatic diseases but up to twenty years ago their practice was limited mainly to the use of mineral waters of the particular spa for the benefit of the poor The use of mineral waters in baths douches etc was the earliest form of physical treatment for rheumatic conditions and was based largely upon empiricism but the last few years have seen great developments in the study of these diseases and of their treatment Without belittling the results obtained under the more primitive conditions it must be admitted that research—clinical bacteriological radiological and biochemical—has opened up a new era with the prospect it is to be hoped of bringing relief and cure to many cases of arthritis etc which would have formerly been regarded as of a hopeless nature from the onset

In such research the leading spa hospitals have taken a prominent part in spite of the many handicaps with which they have to contend They are all supported by voluntary contributions and are entirely independent of the administration of the spa itself Consequently except at Bath which has its own difficulties they are hampered by the system of subscribers letters of recommendation and it is not an easy matter to keep patients suffering from arthritis in the hospital for the long period which is desirable in those cases where in patient treatment alone is capable of giving anything like good results Too many patients are sent to spa hospitals under the impression that they are merely convalescent homes and beds are thus occupied which might otherwise be used to greater advantage for conditions in which the special methods of investigation and treatment available may make all the difference to prognosis

The use of a subscriber's recommendation to secure a cheap and pleasant holiday is not unknown subjective complaints of muscular rheumatism and the like being put forward as an excuse Another large class of cases needing to be regulated in their use of these hospitals is chronic osteo-arthritis for which little can be done and that little should be available in out patient clinics for physical treament

If the available accommodation could be greatly increased it would probably do more for the effective treatment of arthritis than could be attained at as low a cost in any other way A proper system by which their advantages could be restricted to suitable cases instead of to patients fortunate enough to get the recommendation of a subscriber and by which the patient could be kept in the hospital as long as he was making better progress there than could be obtained at home even within reach of a physical treatment centre is essential if the best use is to be made of the spa hospitals The important factors in treatment—rest favourable climatic conditions diet and nursing—are under present conditions only to be obtained in such institutions They should stand in the same relation to the treatment of arthritis as do sanatoriums to the treatment of tuberculosis the analogy is sound and its importance cannot be too strongly insisted upon

While in patient treatment is spoken of it must be understood that patients are only confined to bed exceptionally Those suffering from febrile conditions acute arthritis or spondylitis and severe sciatica may need to be kept in bed for a part at least of their stay in the hospital Other patients are at liberty to go out of doors during the daytime for exercise and fresh air are important factors in assisting the effect of treatment and in restoring health

In addition to mineral baths these hospitals are fully equipped for treatment by electricity by light rays—ultra-violet and infra red—by massage and by manipulation A massage school is a feature of one of them in which students are fully trained for the examination of the Chartered Society of Massage and Medical Gymnastics At Bath Buxton and Harrogate orthopaedic treatment is carried out under the direction of visiting surgeons a most important feature in the treatment of many joint conditions and especially in spondylitis Cases requiring operation for the relief of deformity are transferred to other hospitals

Radiological investigation is fully provided for by modern installations in skilled hands and excellent work is done Bacteriological and biochemical examinations are part of the routine in all cases in which they can possibly be of any service in diagnosis and treatment Many important pieces of original research have emanated from the laboratories of the spa hospitals

BATH

The Royal Mineral Water Hospital was founded in 1738 and was incorporated in 1739 by an Act of Parliament in which it is stated that any person resident in and belonging to Great Britain or Ireland whose circumstances are such that they are not able to have the benefit of the Bath waters without charitable relief are entitled and have a right to the relief of the Hospital It has now 158 beds and 1 145 patients were admitted in 1932 with an average duration of stay of forty four days There are no out patients The hospital is fully equipped for all forms of mineral water and electrical treatment and massage There is an x ray and dental department and a laboratory with a full time pathologist In addition to mineral baths of all kinds supplied by the Bath mineral springs there is a complete electrical installation and special attention is given to orthopaedic treatment

BUXTON

The Devonshire Hospital for Rheumatic Diseases had its origin in a charity which provided free use of the mineral waters for the poor the first published report was in 1785 Accommodation for in patients was first provided in 1858 through the munificence of the sixth Duke of Devonshire and to this the hospital owes its name It has now 300 beds and in 1932 treated 3 504 in patients and 514 out patients the average stay in hospital being twenty five days Admission is by subscriber's letter as a rule but arrangements are made for admission of a limited number of cases by a special subscription equal to the cost of maintenance The baths are supplied by the Buxton mineral springs and in addition there is a complete installation for electrical and light treatment and a massage school A bacteriological laboratory with a full time pathologist was provided in 1912 together with an x ray outfit This has been brought fully up to date and there is a full time radiographer A special feature is also a laboratory for chemical research which has a full time biochemist at its head Orthopaedic work is carried out under the direction of visiting orthopaedic surgeons and is a special feature

HARROGATE

The Royal Bath Hospital was founded in 1824 and rebuilt in 1888 with it is associated the Rawson Convalescent Home There are 150 beds and 1 805 patients were admitted during 1932 the average length of stay being twenty three days Admission is by subscriber's letter and is subject to the approval of the honorary physicians though admission to the Rawson Home can be arranged at one and a half guineas a week subject to the approval of the committee In common with the other spa hospitals rheumatic diseases are the chief conditions treated but disorders of the liver and skin diseases are also admitted The sulphur waters are supplied from the wells of the Harrogate Corporation and patients have the free use of the whole range of the waters for drinking purposes There is full provision also for electrical

NORTHERN BRANCH

BRITISH MEDICAL BUREAU

(THE SCHOLASTIC, CLERICAL & MEDICAL ASSOCIATION LIMITED)

33, Cross Street, MANCHESTER

Telephones {MANCHESTER BLACKFRIARS 3925 / MANCHESTER RUSHOLME 2549 (Night calls)

Telegrams "LOCUM MANCHESTER."

TRANSFER OF PRACTICES & PARTNERSHIPS
INTRODUCTION OF RELIABLE ASSISTANTS & LOCUMTENENTS
VALUATION AND INVESTIGATION OF PRACTICES ETC.

Practices & Partnerships Wanted — **Large List of Bona-fide Purchasers with Ample Capital Available**

FOR DISPOSAL.

Full Particulars Free on Request.

LARGE LANCS TOWN near Manchester — Old-established mixed PRACTICE. Average cash receipts £1 080 p.a. Panel 1 060 Scope Good house 2 reception 4 bedrooms garage and garden to rent Premium 1¼ years purchase.—No 457

LINCOLNSHIRE — PARTNERSHIP in old-established Country PRACTICE practically unopposed Cash receipts over £2 000 p.a. Panel 1 805 House available with 5 bedrooms garage and garden Rent £40 p.a. Premium—one-third or one-half share—1¼ years purchase.—No. 473.

MANCHESTER.—Established Panel and private PRACTICE. Average aging about £1 300 p.a. Panel 1 800 Good scope. Excellent house in main road 3 4 bedrooms reception room and professional rooms. Price for fresh 11 £1 150 Premium 1¼ year purchase.—No 451

NORTH WEST COAST — PARTNERSHIP (after six months assistantship) in mixed panel and private Practice averaging £5 263 p.a. Panel 2 500 and appointments Good house with garden and garage to rent Salary £500 Premium—1 4 share — 1½ years purchase Further share later.—No 415

MANCHESTER.—PRACTICE on large Housing Estate offering great scope Cash receipts last year £647 Panel 430 Good house 3 bedrooms etc Rent 22/- per week clear Premium best offer.—No 474

LAKE DISTRICT — Small Seaside Town — Beautiful district.—Mid Health PRACTICE. Cash receipts over £800 p.a. Panel 250 Excellent freehold house (on sea front) 3 reception 5 bedrooms garage and pleasure garden For sale or may be rented on lease Premium 1¼ years purchase.—No 388

LARGE LANCASHIRE TOWN near MANCHESTER.—Sound mixed PRACTICE. Average cash receipts £1 480 Panel 1 466 Good detached modern house 2 reception 4 bedroom garage and garden Premium 1½ years purchase.—No 456

SCOTLAND (S.W.).—Unopposed Country PRACTICE. Average cash receipts £700 p.a. Panel 350 Scope Good house (electric light) 2 reception 4 bedroom Rent £18 p.a. Premium 11 years purchase.—No 470

LARGE LANCS TOWN.—Old-established PRACTICE. Cash receipts last year average £1 000 p.a. excluding appointment £150 p.a. Panel 750 Nice house 2 reception 5 bedroom garage and garden to rent Premium best offer.—No 472.

NORTH WEST COAST.—Partnership. Cash receipts about £1 200 p.a. Panel 1 300 Excellent detached modern house (freehold). 3 reception room 5 bedroom and 2 reception room garage and small garden for sale Premium—Practice—1½ year purchase.—No 417

LANCS TOWN.—Mixed general PRACTICE. Cash receipts last year approx £1,500 Panel 829 Scope for surgical work. Good house containing Operating Theatre 3 reception 2 small wards and living accommodation Rent £60 p.a. lease Premium £1,500.—No 460

EAST COAST — Country Town near Coast.—Unopposed PRACTICE. Cash receipts last year £950 Panel 600 Excellent detached house 3 reception 4 bedrooms garage and large garden Premium 1¼ years purchase.—No 345

LARGE LANCS TOWN.—Well-established mixed PRACTICE averaging £3 267 p.a. Panel 500 Appointments £60 p.a. Partnership with succession in 12 18 months

Good semi-detached house 3 reception 6 bedrooms garage and garden For sale or will let on Lease Valuable retiring Premium

year purchase.—No 443

NEAR MANCHESTER.—Old-established mixed PRACTICE. Average cash receipts over £500 p.a. Panel 600 House in main road 2 reception 4 bedroom Rent £40 p.a. Premium best offer.—No 446

LARGE LANCS TOWN.—Old-established PRACTICE average Panel 1 295 House 2 reception Garage and large garden Premium offer.—No 467

NEAR NEWCASTLE.—Mixed general PRACTICE average £80.—Good house 3 reception 5 bedrooms garage and garden Premium £—

MANCHESTER.—Old-established PRACTICE Cash receipts last year £945 Panel 600 House 2 reception 4 bedrooms garage and garden to rent Premium £ 1½ years purchase or lease.—No 437

MEDICAL WOMAN'S PRACTICE.—NORTH HOME COUNTIES. Receipts last year £415 Panel 4 Residential part 2 reception Premium lease or —No 471

NEAR HULL.—Mixed general PRACTICE near Hull in East Riding Premium £52 p.a. Panel about 600 Premium 1½ year purchase.—No 462

MANCHESTER.—Old-established PRACTICE. Cash receipts last year £945 Panel 600 House 2 reception 4 bedrooms garage and garden to rent Premium

British Medical Bureau

(THE SCHOLASTIC, CLERICAL & MEDICAL ASSOCIATION LTD)
(FOUNDED 1880)

12, Stratford Place,
Oxford Street, W.1.

Tele Address: Triform Wesdo—London

Telephone Mayfair {1782 1783

The Association has long been favourably known to the members of the Medical Profession as a thoroughly trustworthy and successful Agency for the transaction of every description of Medical, Scholastic and Accountancy business, and the BRITISH MEDICAL ASSOCIATION has every confidence in recommending its members to consult Mr A V STOREY, the General Manager, in all transactions requiring the services of a Medical Agent

Members of the British Medical Association may take advantage of a reduced scale of charges applicable to them

The business undertaken by the British Medical Bureau is divided under the following heads —

TRANSFER OF PRACTICES, PARTNERSHIPS, etc.

Medical Practitioners wishing to dispose of Practices, or desiring to take Partners, are advised to negotiate the business through the British Medical Bureau Vendors may depend upon receiving introductions only to eligible and bona-fide purchasers All information is treated in strictest confidence Full and trustworthy information regarding Practices, Partnerships, etc, for disposal, supplied gratis to Purchasers

ASSISTANTS AND LOCUM TENENS

Assistants and Locum Tenens can be secured at short notice It is the foremost aim of the British Medical Bureau to ensure that only the most Trustworthy and Reliable Locums and Assistants are sent out

RESIDENT PATIENTS

Medical Men wishing to receive Resident Patients should enrol their names on the books of the British Medical Bureau A large number of Patients are placed yearly through this medium

ACCOUNTANCY.

The British Medical Bureau has its own staff of qualified Accountants wholly engaged on medical work—i e, Investigation of Practices for purchasers, Income Tax, Auditing Accounts, etc

Practices and Partnerships for Disposal.

Full particulars sent free.

1 FAMOUS INLAND WATERING PLACE AND HEALTH Resort —Well-established Receipts last three years average of 280 fees 5/ to £1 select Panel house with large garden, for sale

2 BIRMINGHAM — PARTNERSHIP (AFTER PRELIMINARY Assistantship) in Suburban Practice of about £2 500 p a Increasing Panel of 2 400 House (5 bedrooms, etc) with garage accommodation to rent at about £65 p a Applicant should have held Hospital Appointments and have experience in General Practice Two fifths share would be sold at first to suitable man at 2 years purchase

3 LONDON E —OLD ESTABLISHED CASH AND PANEL PRACTICE of about £1 200 p a in residential part of populous district Good appointments and panel 950 Small house (3 bedrooms etc) in pleasant road to rent on lease Scope for increase Premium 2 years purchase

4 SUFFOLK AND NORFOLK BORDERS —SMALL PRACTICE IN Market Town Cash receipts 1932 £285 including panel of 80 Nice house (6 bedrooms) garage and good sized garden Price of freehold £850 Excellent schools Plenty of sport Cottage Hospital Premium £450

5 LONDON E —CASH AND PANEL PRACTICE OF OVER £600 p a in populous district Panel 590 Small house to rent on lease Premium £800

6 LONDON S E —WELL ESTABLISHED PRACTICE AVERAGING £1 715 p a in populous Suburban District Panel about 1 650 Plenty of scope for midwifery House (4 bedrooms garage etc) held on long lease at nominal rent Premium 2 years purchase

7 S WALES —ASSISTANTSHIP PRELIMINARY ASSISTantship) in of nearly £5 000 p a in important appointments and panel of nearly 3 00 Assistantship a one third share would be sold at first to a suitable man who should have held Hospital Appointment and have some knowledge of Midwifery and Anaesthetics

8 N W OF ENGLAND —SEAPORT TOWN —PARTNERSHIP IN well established Practice of about £1 500 p a Panel 1 660 Great scope for Increase Premium two fifths share £1,000

9 KENT — FOURTH PARTNER REQUIRED IN OLD ESTABlished Country Practice within easy reach of London Freehold house standing in three and a half acres of garden, to be purchased Price £2 000 Incoming Partner should be keen on country life and have held H P and H S appointments Share worth £800 p a, guaranteed Premium £1 600

10 W OF ENGLAND — PARTNERSHIP IN OLD ESTABLISHED Practice of about £1 200 p a in picturesque Seaside Place Panel 690 Unique house (6 bed and dressing rooms etc) in excellent state of repair with every modern convenience Beautiful garden and garage to rent on lease Hunting yachting fishing etc Premium one half share 2 years purchase

11 WEST OF ENGLAND —PARTNERSHIP IN OLD ESTABLISHED PRACTICE over £2 200 p a in County Town Panel about 1 000 Premium one half share 2 years purchase. Good prospects for well qualified physician (preferably M R C P) who should be an R C and who would have opportunity of getting on Staff of Hospital in near future.

12 LONDON N —PRACTICE CARRIED ON BY MEDICAL WOMAN in populous area Cash receipts average £480 p a including panel 527 Visits 2/6 to 3/6 Small house (6 rooms) to rent at £50 p a on lease Practice capable of increase Premium 1½ years purchase

and light treatment and massage Radiologists bacteriologists and a research chemist are attached to the staff A rheumatism research centre is about to be established and a whole time research worker appointed under the aegis of the University of Leeds

OTHER SPA HOSPITALS

There are smaller institutions for the spa treatment of the poor at Droitwich Llandrindod Wells, Strathpeffer and Woodhall Spa, but at some of these a small payment is required They are capable of great expansion on the lines of the hospitals at Bath, Buxton and Harrogate, and this is very desirable to meet the increasing demand for such treatment as they afford to patients of the poorer classes At the Warneford Hospital at Leamington there is also provision for mineral water and electrical treatment, though it is in the main a general hospital

SOIL AND CLIMATE IN RELATION TO RHEUMATIC DISEASES

DISCUSSION AT THE EASTBOURNE PUBLIC HEALTH CONGRESS

At the annual congress at Eastbourne of the Royal Institute of Public Health on June 1st a discussion took place on "Soil and Climate in Relation to Rheumatic Diseases" This was believed to be the first occasion on which medical men and meteorologists had participated in a joint discussion, and the chair was taken by SIR GILBERT T WALKER, F R S, professor of meteorology at the Imperial College of Science and Technology

DR E C WARNER (assistant physician, Charing Cross Hospital), in introducing the subject, spoke first of juvenile rheumatism, though bringing in to some extent the acute rheumatism of adults He said that the relationship to climate must be considered over a period of years There was considerable variation in the intensity of acute rheumatism from one year to another some years were more or less epidemic in this respect Acute rheumatism was distributed more particularly in the temperate and subtropical zones, and in the northern hemisphere the figures for the large hospitals showed that from 3 to 7 per cent of all admissions were cases of this type The disease was much rarer in the Tropics and in the Arctic, where the Eskimos were almost immune He gave some figures showing the variation in incidence with latitude in the United States For five recent years the incidence of rheumatic cases to total medical admissions in the part of the United States near the Canadian border, in latitude 45–50°, was 2 7 per cent , in latitude 40–45° it was 1 5 , in latitude 35–40° it was in the neighbourhood of 0 6 , and towards the Mexican border it was about 0 3 In this country it was a little difficult to assess the difference between inland and coastal climates, and information was lacking as to variations between place and place It was stated, though also denied, that in Cornwall the Isle of Wight, and Guernsey rheumatic disease in children was particularly rare The influence of sunshine was also difficult to assess From the fact that the maximum number of cases occurred in the winter months it might be inferred that sunshine was beneficial, as it undoubtedly was in treatment, but that would hardly apply in the instance of the Eskimos, where rheumatism was a curiosity Observations by Newsholme and Sandison had shown that after a summer of unusual sunshine the incidence of rheumatism was much higher in the succeeding winter Dampness was another factor to be considered, lowering resistance as it did to all types of disease, not juvenile rheumatism only The greatest incidence of juvenile rheumatism occurred along the course of rivers or former watercourses, or even on the sea coast In New York some investigation had shown that the smallest number of cases occurred in districts furthest away from the river, and Dr Butterworth had shown the same kind of thing in Wigan a few years ago In the St Thomas's Hospital investigation by the Medical Research Council an unduly large proportion of persons who had suffered from rheumatic fever were found to have lived within half a mile of the Thames, the Wandle, the Graveney, or the Surrey Canal In the middle floors of tenement houses rheumatism was rarer than in the top or bottom floors suggesting again that dampness played a part But if dampness was such a considerable factor, why was the incidence of juvenile rheumatism in Holland comparatively low, and why should the incidence in country children be lower than in town children, seeing that the former had to walk long distances to school across damp and muddy fields? In 1914 Newman found that the incidence of rheumatic heart disease in industrial areas was 8 per cent , in residential areas 5 9 per cent , and in rural areas 2 6 per cent This was borne out by the figures for Army conscripts in the war, when, in the men from industrial Cardiff, the incidence of valvular disease of the heart was 22 per 1,000 examined, while in the rural areas of Carmarthenshire it was only 2 per 1,000 Again if dampness played such a part, why was the incidence so low at Eton and other colleges on the river? It looked as though dampness of the neighbourhood might be of not quite so much importance as dampness of the individual and his immediate surroundings It had been suggested that the reason why the very poorest families showed a lower incidence of rheumatic fever than the artisan class was because the latter lived in single houses, perhaps of the "mushroom" type, not properly dried before habitation, whereas the poorest families lived in tenement houses where the degree of dampness was probably less It was generally accepted that higher ground gave relative freedom from juvenile rheumatism and heart disease So far as could be ascertained in this country, prevailing winds had very little effect, but rapid temperature variations did play an important part, liable as they were to produce chill The mean air temperature taken over a period of time showed no influence at all , it was the temperature variations which were of most importance, as had been recently confirmed by some work at Oslo As for soil, it was an old story that clay tended to promote juvenile rheumatism, but this was not adequately confirmed by statistics Coming to adult rheumatism, Dr Warner said that there was here an extraordinary paucity of information The general distribution of adult rheumatism was very much the same as juvenile It was common in this country, Germany, Holland, Scandinavia, and Eastern America, rather less common in France and in the south In Lancashire the incidence of rheumatism was particularly in the direction of lumbago and sciatica, while osteo arthritis was often called the "Manchester disease" Rheumatoid arthritis was much more commonly met with in the south east and south-west of England There was great variation in respect of gout In Birmingham and Northampton the incidence was high (in the latter town, 7 5 per 1 000 insured persons), but in Hull, Exeter, and Norwich it was under 1 per 1,000, though Norwich was celebrated for brewing, and on the Continent, in Leipzig particularly all types of adult rheumatism were shown to be high among people engaged in the brewing trade The period of year, again was important The incidence was highest in winter and at the minimum in summer Dampness, either of the district or of the house, was known to increase the incidence of painful adult rheumatism Sciatica was four times as common in men as in women, the difference being related probably to their occupations Metal workers had been found to show a high incidence of rheumatism, particularly fibrositis and neuritis Puddlers among steel workers were extremely susceptible, probably because their work entailed short spells of hard labour followed by long periods of rest, very often in draughty areas With regard to water supply, he believed that very hard water in certain districts did predispose to fibrositis, which was common in good class residential districts in the South of England, but in joint troubles the quality of the water had little influence The drink

ing water in Lancashire was one of the softest in the country while in spas the drinking water was very hard There was no relation between the plumbo-solvency of water and the local incidence of gout

Dr JANET ATTLEY (physician to the Princess Louise Hospital Kensington) said that she had picked out seven places at random from a variety of districts which claimed to have a climate beneficial to rheumatic infections and had classified their weather conditions In one of these places the rainfall and rain-days were markedly above the average for the country and the sunshine and temperature markedly below In two the daily range of temperature was well above the average and in two others well below the average and the same was true of sunshine The rainfall was only below the yearly average in one and the relative humidity was near the normal in all except one where it was below One writer had suggested that the level of human energy and achievement was the function of climate A mean temperature of 64° F seemed to be the most nearly ideal for productive activity But some investigations in America showed that in storm areas where variations of temperature were greatest danger arose from over-stimulation of the ductless glands and failure of their function and statistics had been produced showing that diabetes Graves's disease and pernicious anaemia were particularly prevalent in those areas She did not think that generalization could be made as to any one climatic factor At the supervisory clinic in Kensington careful investigation had been made into the environmental factors in 466 cases of juvenile rheumatism the environment being taken to include the dampness of the district as well as of the houses and the soil on which they were built. In this district there were certain flood areas and old stream tracks made it difficult to prevent dampness in some of the houses Part of the borough also was built on clay soil No connexion however could be found between the incidence of juvenile rheumatism and these two factors

Dr F J BACH (chief assistant cardiographic department St Bartholomew's Hospital) said that in his experience climate had not quite such an important part in the incidence of juvenile rheumatism as many supposed The effect of climate lay much more in modifying the clinical picture than in causing the disease itself Climate and soil might affect the individual either by causing the disease or accentuating certain manifestations in symptomology and clinical signs or by arresting the disease process and with it naturally causing the symptoms to disappear It was known that arthritic pain was related to changes of weather and it was common knowledge that a patient suffering from rheumatoid arthritis felt better and his pains were less severe in a dry and hot climate than in a wet and chilly one It was quite amazing how certain arthritic patients were able to detect the approach of a storm This was well appreciated in bygone times and from some old verse the speaker quoted the couplet

> Hark how the chairs and tables crack
> Old Betty's bones are on the rack

At the same time there was no doubt that the climatic factors might not only modify the clinical picture of the disease but definitely cause it Aetiologically fibrositis and muscular rheumatism divided itself into four main groups according to causation (1) cold or chill (2) fatigue or over exertion (3) infection and (4) associated metabolic changes such as gout and obesity

Dr W S C COPEMAN (physician British Red Cross Society Clinic for Rheumatic Diseases) said that he considered the physiological manifestation of the adult rheumatic diathesis to be an abnormality of the heat-regulating mechanism of the skin and that it was on the basis of this abnormality that meteorological or climatic factors were able to produce their undoubted effects It had been pointed out that apparently no one climatic factor could be held responsible and as a result certain people were rather apt to ignore the effect produced by several of these factors in conjunction It had been shown that mere variations in temperature however marked were not in themselves sufficient to produce the pains and symptoms of rheumatic disease neither apparently was damp Dr Copeman thought however that these factors in conjunction when they did not constitute the permanent climatic condition of the particular environment would appear to be operative in all the cases mentioned Captain D Brunt of the Air Ministry in a paper read earlier in the proceedings had shown that soil containing 20 per cent. of moisture returned only one fifth of the radiation which dry soil was capable of returning This meant that in damp localities the temperature variations in the twenty four hours were considerably less marked than was the case in those well-drained dry localities which were suitable for rheumatic patients This observation was contrary to the general lay belief and confirmed the importance of the conjunction of cold and damp in these cases In certain localities where the subsoil was known to be impermeable to moisture this effect was negatived by the fact that drainage might occur through the subsoil owing to the elevation and slope of the country Examples of the double effect of cold and moisture producing rheumatic pains were to be found in the fact that the seaside was generally unfavourable for these patients in the high incidence of rheumatism amongst iron puddlers who worked at high temperatures for short periods in the rheumatic pains which were exacerbated before a rain storm and in the chill which resulted even in hot weather when people sat in non porous clothes after exercise which had induced perspiration It was Dr Copeman thought obvious that climatic factors were nowadays not the only villains of the piece since by the aid of clothes and bed-clothes we lived largely in an artificial micro-climate of our own choosing and were therefore to a very large extent independent of Nature's climate The speaker expressed his belief also that in all diseases which like rheumatic fever could show a definite class incidence it was likely that a dietetic factor was also concerned In conclusion he agreed that at present too much time was being devoted to the investigation of the rheumatic seed and that a discussion such as the present one would help to direct attention to the need for further investigation of the soil and also to the danger of forgetting what had in the past been discovered in connexion with the various natural phenomena concerned

Dr WILFRID SHELDON (junior physician Children's Department King's College Hospital) said that most people regarded acute rheumatism of childhood as due to an infection and if that was so soil and climate must be regarded as secondary factors They did not on that account lose very much in importance and as secondary factors they might operate in several ways by influencing the infecting germ or by modifying the body's resistance He could not doubt that climate influenced rheumatism though he did not think it had any very obvious relation to chorea Certainly it was more closely related to rheumatic polyarthritis and closest of all was the relation of climate to rheumatic pains in the limbs It was common to find aching in a child's arms and legs much worse when the weather was wet During 1929 he tried to correlate the number of complaints of pains in the limbs with the rainfall for the year The work was based on the weekly study of one hundred child out patients In the early part of the year the number of children complaining of pains was high although the rainfall was lower than the average but afterwards the rainfall curve was followed very closely—even to an exceptionally high peak in early July Again during the drought in September of that year no children complained of pains He went on to discuss the micro-climate of the individual Much could be done to help these children by controlling to some extent their clothing The ideal garment next the skin was one which was a poor conductor of heat and if the clothing was porous there was plenty of air space Woollen blankets were more porous than sheets as well as warmer and it was a common thing to advise mothers to put their rheumatic children between blankets and to take the sheets away

All communications to be addressed to Mr. A. V. STOREY, General Manager

entirely For clothing, wool or better still some of the new cellular materials, were the most porous A material was wanted which was either non hygroscopic or, if hygroscopic, parted with its moisture readily by evaporation The least hygroscopic of materals was wool Cotton and cellular materials were hygroscopic but the very loose weave of the cellular material allowed of rapid evaporation

Dr J F HALLS DALLY (director, Marylebone Children's Rheumatism Supervisory Centre) submitted the view as a working hypothesis that rheumatism was primarily the outcome of an inherent failure of adaptation to environment especially a failure of the heat-regulating mechanism, and that rheumatic and potentially rheumatic children possessed a certain type of constitution which might become manifest clinically by numerous signs and symptoms A heavy rainfall, especially on a subsoil of low humidity had been termed an advantage rather than a drawback from the point of view of health A rainfall not too persistent to keep children continually indoors might probably be regarded as non-productive of rheumatism Danger would appear to arise from chill, and sleeping in unaired beds came under the same category It was through the medium of the skin that the child like everyone else, adapted or failed to adapt himself to his environment With regard to prevailing winds thyro adrenal instability was a characteristic of the allergic state and those children in whom the allergic factor predominated were prone to disturbance when the wind was in the east for two or three successive days Meteorological changes were of more importance than climate , in other words it was the changes which were important, particularly when sudden and marked Some barometric variations were liable to produce restlessness and irritability in children with an unstable disposition To most people the rapid variations in atmospheric conditions were beneficial, because they did not go beyond the point of adjustment but with the rheumatic child the limits of adaptation were soon exceeded Cold, damp air was devitalizing and children exposed to this must be kept on the move Evidence derived from investigations at the Marylebone centre had shown that damp houses did not appear to warrant the environmental importance attached to them by some observers With regard to sunlight, Rollier and others attributed its beneficial effects chiefly to its luminous and infra red rays Intensity of solar radiation, however, varied directly with season latitude, and altitude, and inversely with cloud, humidity, and dust In England the continuous duration of sunshine was too brief and interrupted for acclimatization to take place so that heliotherapy and ultra violet radiation, although apparently valuable for rheumatic children, should be always initiated gradually and continued cautiously excess resulting in devitalization

Dr L C HILL (Devonshire Hospital Buxton) described the result of an investigation which he had carried out from 1929 to 1932 on a large number of male in patients of the Devonshire Hospital suffering from some form of rheumatism He had divided them into three groups according to occupation—indoor, outdoor and miners—desiring to obtain, with regard to the last named information as to the possible effects of spending a considerable proportion of the day in a rather warm, humid atmosphere devoid of sunshine and light The results were as follows

	Number of Cases	Fibrositis	Subacute Rheumatism	Rheumatoid Arthritis	Osteo-Arthritis
		Per cent	Per cent	Per cent	Per cent
Indoors	533	39	20	29	12
Outdoors	625	51	10	15	24
Miners	670	65	12	11	12

It appeared that hot atmospheres were not necessarily harmful if not too humid That might be due to the fact that miners wore very little clothing, and so did not hamper the action of their skin A hotel manager in Buxton had recently asked him whether it was worth while to put a sun lounge with "vita glass in the hotel because he had noticed the curious fact that a large number of crippled people seemed to avoid the sunshine Sunshine, particularly coming suddenly definitely enhanced rheumatic pains In rheumatoid arthritis the influence of climate in stimulating metabolism and increasing resistance was of great importance, but patients varied widely in their powers of reaction

Dr REGINALD LIGHTWOOD (Great Ormond Street Hospital) mentioned certain investigations in Kensington in connexion with acute and subacute rheumatism North Kensington, he said was a poor and congested area, while South Kensington was well to do About 10 per cent of the rheumatic cases came from South Kensington and 90 per cent from North In North Kensington there had been certain damp areas, due to the periodical flooding of old watercourses but that trouble had been removed of recent years Curiously enough, one damp area in a congested part of North Kensington was full of rheumatic cases and another damp area in the Holland ward, which had only a small and uncrowded population, had very little rheumatism Overcrowding and poverty were probably much more important aetiological factors than climate in the production of rheumatism in children To day one was being forced to discount the importance of dampness and to recognize the importance of overcrowding and bad ventilation

Dr J L NEWMAN (late assistant medical officer Fountain Hospital, L C C) spoke of some investigations carried out in an institution for low grade mentally defective children, of the average age of from 6 to 10 Of 1,700 children examined only seven were found to have contracted rheumatism actually in the hospital, yet this hospital stood only 50 feet above the sea, close to the River Graveney, and, as the name of the hospital implied, it was connected with watercourses The buildings themselves were on the pavilion plan, and had been put up very rapidly to accommodate an overflow of fever patients during an epidemic The ground underneath was excessively wet, and even after a slight shower the airing courts flooded regularly There was a cellar eight feet deep under the main block, and if it were not regularly pumped out it would flood even in summer From the point of view of an assemblage of conditions favourable for the propagation of rheumatism it would be difficult to find a more suitable site On the other side, of course there were the factors of good ventilation, lighting, plentiful spacing of beds, and the suitable dressing of the children The children were not over dressed, wearing cotton in summer and flannel in winter, and in wet weather they walked under covered ways The absence of infection from outside might be another limiting factor but outbreaks of scarlatina and epidemic sore throat had occurred Yet rheumatism was singularly absent

Dr G C SIMPSON, F R S (Director of the Meteorological Office), pointed out that people living in the most damp surroundings, such as sailors and fishermen were not particularly affected by rheumatism, while as for cold, in the Polar regions rheumatism was almost unknown It seemed clear that climate was not a primary predisposing cause , it was doubtless a secondary factor but, of course, climate was always a secondary factor for the healthy as well as for the ill He related his own experience on an Antarctic expedition, where he spent two days digging a cave in an ice cliff, with the ice accumulated around him, the temperature being very nearly zero of the Fahrenheit scale Afterwards he suffered from the most intense rheumatic pains, although he had never had rheumatism in his life before Dr Simpson added that very few people realized that, after all climate normally only acted upon us for about one third of each day There was no climate in the bedroom, nor, generally speaking, in the living rooms which were protected against changes of temperature Therefore one would not expect the climate to be of the absolute importance that was often attributed to it

SATURDAY, JUNE 17th, 1933

THE ARTHRITIS COMMITTEE S REPORT

It has been generally agreed for many years that chronic arthritis is of the greatest moment to the community owing to the crippling effects and widespread incidence of this group of diseases It is regrettable however that although the medical profession is and has been well aware of the importance of the subject there has been no agreement as to classification or aetiology and consequently no standardization of the principles of treatment The result has been that sufferers from chronic arthritis have been mystified by conflicting advice discouraged by the pessimism and uncertainty of their legitimate advisers and in consequence too often driven to seek help outside the ranks of the profession from those whose assurance of cure is directly proportionate to the depth of their ignorance of the subject The sociological implications of arthritis were focused by the report of the Ministry of Health published in 1924 with its astounding figures of working hours lost and money expended annually as a result of arthritis of all kinds In view of the interest thus aroused a conference on rheumatic diseases was held at Bath in May 1928 under the presidency of Sir George Newman and with Lord Dawson Sir Humphry Rolleston and Sir Farquhar Buzzard as presidents of Sections At this conference many papers of great interest and importance were presented and published later in book form but its main outcome was to reveal how widely authorities differed and how uncertain was the guidance which the profession offered to the public Of recent years an International League against Rheumatism has been formed to promote the study of the subject in all countries to encourage research and to exchange views at annual meetings held at various European centres Valuable as such work must be it provides no immediate prospect of co-ordinating results or of defining how much of the theory and practice of medicine in the field of chronic rheumatism rests on solid foundation and how much rests on premisses which reflect the fertile imagination of their originators rather than their diligence in the accumulation of scientific observations

Such being the state of affairs the Section of Hydrology at the Annual Meeting of the British Medical Association at Eastbourne in 1931 decided to ask the Council to appoint a committee to survey the subject of arthritis with special reference to the present state of knowledge the indications for future research and the facilities for educating the profession in this special branch of medicine The Council was fortunate in obtaining the services of a strong body of experts in all aspects of arthritis under the chairmanship of Sir Humphry Rolleston with Dr R G Gordon as honorary secretary In receiving the report of its committee which is printed in full in this number of the *Journal* the Council expressed its gratitude to all members of the committee and especially to the chairman and honorary secretary for the labour and skill they had expended in the preparation of the report At the outset the committee was faced by the very serious difficulty that scarcely any authorities agreed as to the classification or even the nomenclature of the diseases to be included in its reference The committee decided to exclude from its consideration those forms of arthritis whose causation was reasonably clear—that is the specific forms of arthritis such as those due to gonococcus pneumococcus and dysentery bacillus that due to frank metabolic abnormality (gout) and that due to neurotrophic changes (Charcot s joints) Of necessity this confined the committee s reference to those conditions whose aetiology was obscure and in consequence a scientific aetiological classification was impossible Recourse was therefore had to a clinical nomenclature comprising rheumatoid arthritis osteo-arthritis chronic villous arthritis spondylitis and fibrositis and so far as possible other nomenclatures were correlated with these Such a terminology is obviously open to criticism For example many will consider that rheumatoid arthritis and osteo-arthritis are outworn and meaningless expressions yet these have the sanction of use and familiarity and the alternative terms atrophic and hypertrophic proliferative and degenerative are in some respects confusing Again others will assert that there is no justification for separating the two forms of spondylitis from rheumatoid arthritis and osteo-arthritis respectively or for separating chronic villous arthritis from osteo-arthritis but in the opinion of the committee both spondylitis and chronic villous arthritis are distinguishable enough both clinically and aetiologically to warrant separate treatment This clinical distinction between the various forms of arthritis with stress on the varying causative factors so far as they are known is a very important feature of the report in view of the tendency of recent years for writers to present all forms of arthritis as variants of one morbid condition for which there is some specific remedy Such a presentation has the merit of simplicity but the defect that it is entirely untrue and we hope therefore that the wide publicity now given to the committee s report will help to correct this heresy

Naturally the subject of vaccine therapy occupied the attention of the committee and was carefully reviewed great assistance being obtained from the critical and judicial contributions of the expert bacteriological members The uses and limitations of vaccine therapy are clearly laid down and attention is drawn to the advantages of small doses Diet in arthritis is of perennial interest to the community as a whole and it would seem that the only reason why patients have more varied theories on this subject than medical men have is that the former still outnumber the latter On this subject the report is emphatic There is no specific diet for chronic arthritis and any dietetic restrictions which may be desirable for a given patient are desirable on

secondary grounds, such as obesity, personal idiosyncrasy, and the like, and not because he is a sufferer from arthritis *per se* In the rheumatoid group, generosity within the limits of digestion and not restriction of diet is indicated The investigations of the committee disclosed serious gaps in our knowledge For example, in spite of the researches of Dr Alison Glover into the incidence of arthritis, which are set out in the report of the Ministry of Health already referred to, practically nothing is known of the relative incidence of these various forms in different classes of the community or in different occupational groups Again, radiological and biochemical investigations disclose certain results which appear to be at variance with the findings of the clinicians—a further difficulty It is obvious that both radiology and biochemistry hold out great hopes for the solution of many problems in connexion with arthritis, and if the results of research so far have in many respects been negative, this can only serve as a stimulus for further work The committee has formulated schemes for a national organization for the treatment of this group of diseases, and for post-graduate instruction of the profession, and through the Council it has forwarded a memorandum to the Home Office on the exploitation of the arthritic public by vendors of quack remedies

A word may be said as to the form of the report, since to some it may appear to be repetitive, and in certain respects to lack balance The main object has been to present to the practitioner an authoritative statement on the subject of arthritis which may serve him as a guide amongst the shoals of conflicting theories and the enthusiastic assertions of the advocates of panaceas Brief reviews of the main features of the forms of arthritis under discussion have therefore been given at the outset, so that he may quickly refresh his memory as to the salient characteristics and the main lines of treatment Differential diagnosis has been dealt with fairly fully, and, so far as possible, in tabular form Special aspects have been detailed in so far as they are of real interest to the practitioner, and with reference to the possibility of obtaining apposite information elsewhere Thus, little is said in the report about morbid anatomy, since it is a difficult and technical subject of no great interest to the practitioner, but reference is made to the articles of Mr Lawford Knaggs in which the whole matter is dealt with in great detail On the other hand, the orthopaedic treatment of arthritis is dealt with at some length, since this is, if not of overwhelming importance, of very great use in the management of any arthritic patient, and in the opinion of the committee information on the subject is difficult to find in the literature, and so not often brought before the notice of the practitioner Whatever the merits or demerits of the report, it is the hope of the committee and of the Council that it may prove to be a useful contribution to the study of this important and difficult group of diseases, and that it may stimulate further inquiry and research whereby the many lacunae in our knowledge may be filled and the present relative chaos eventually give place to order

RHEUMATOID ARTHRITIS

The study of affections of the joints goes back through many generations Though it has been marked by much controversy and dogmatism its therapeutic record is not a distinguished one. A favourable movement appeared when certain areas of the subject became confidently identified and classified as due to particular infections Gonococcal, tuberculous, and syphilitic arthritis, for example, were made aetiologically secure, while acute rheumatism and acute gout each presented a clinical distinctness that justified, both for the one and for the other, a nosological label and recognition Yet in spite of these gains there remained a large body of joint disease, for the most part chronic and progressive in character, where confident knowledge was sadly to seek and therapeutic activity boasted little success To apply to such a condition the term " chronic arthritis " was judged inadequate, and hence the accusations of gout as responsible on the one hand, and rheumatism on the other, were freely bestowed, with the implication that the same agent or influence which produced the acute diseases so named produced also the more chronic disturbances The battle of the names had its lively moments, and not many would content themselves with an agreed truce as expressed in the simple formula proposed by Sir Jonathan Hutchinson that " whenever arthritis occurs in connexion with food we call it gout, and whenever such association is wholly absent we name it rheumatism " The controversy took on a new aspect with the appearance of what at the time seemed a revolutionary claim—namely, that whatever else chronic joint disease might be it certainly was not rheumatism, meaning, presumably, that it was not caused by the agency responsible for rheumatic fever It was to enforce this doctrine that Sir Alfred Garrod proposed the term " rheumatoid arthritis " The name has largely held the field until the present day, but its value has been qualified in two respects First it has been applied, and indeed still is applied, almost indiscriminately to any and every form of joint disease which has not an obvious explanation , and secondly, and in spite of the intentions of its author, the term " rheumatoid " has carried the suggestion that the more or less chronic forms of arthritis to which it is attached are, after all, allied to acute rheumatism, and are to be met in principle by the dietetic and medicinal methods recognized as appropriate to that disease It may be that on the surface something like this habit seems to describe the present position But in recent years many workers, both at the bedside and in the laboratory, have faced arthritis as a problem to be solved, and one of the advantages to be expected from the British Medical Association committee's report is the wide diffusion of the results of these investigations and the adoption of the diagnostic and therapeutic methods to which they point the way As a central proposition, now established, it may be stated that whatever else is doubtful rheumatoid arthritis presents without question a definite clinical picture , that it can be clearly separated from other forms of joint disease , that at

least in many instances it is associated with an infective focus and that it calls for methods of treatment other than those which its supposed alliance with rheumatism would suggest

These positions the steps which have led to their establishment and the practical applications they demand are very effectively stated in a recent article by Dr Russell L Cecil of New York.[1] Broadly Dr Cecil's conclusions march with those of the British British Medical Association committee's report He is however quite uncompromising in relation to focal infection as the cause of rheumatoid arthritis and is correspondingly insistent upon the necessity for the elimination of all septic foci as a starting point in the treatment of the disease endocrine abnormalities disturbed metabolism deficiency influences he will allow as perhaps predisposing but certainly not as causative factors In short what the committee recognizes as possible—namely that sooner or later all cases of rheumatoid arthritis may be proved to have an infective source—has in Dr Cecil's view already arrived He admits that the positive observations of himself and his fellow-workers—namely the successful cultivation of streptococci from the blood in a large proportion of cases of the disease—have not been obtained by other bacteriologists but for these failures as they seem to him he offers explanations and in any event he claims that a few positive facts may be held to outweigh a number of purely negative ones Not less convinced is he that the streptococcic agglutinins present in the serum of patients suffering from rheumatoid arthritis are specific agglutinins differing in no respect from the specific agglutinins that occur in infections with the typhoid bacillus the pneumococcus, and other pathogenic micro-organisms On these two bacteriological issues the committee's report holds that not until further evidence is available can a confident verdict be pronounced and similarly in the practical sphere the report suggests caution and gradualness in dealing with infective foci rather than the radical swiftness which Dr Cecil advocates A somewhat similar contrast may be noted when the subject of vaccine treatment is discussed Both the B M A committee and Dr Cecil agree that vaccines have been too loudly exploited and probably not always used with the care and under the conditions which these agents demand and equally they emphasize that reactions are certainly to be avoided But Dr Cecil having secured his typical strains of streptococcus has naturally prepared a corresponding vaccine has used this both by the subcutaneous and by the intravenous method and on the basis of a large experience he is satisfied that 'undoubtedly a certain number of patients are benefited by the treatment indeed his usual practice is to try intravenous injections for at least three or four months and to continue or discontinue the treatment according as the patient has or has not improved over that period The conclusion of the committee is that given certain conditions vaccines have some opportunity of service and there are other well-known workers whose teaching on this point is much more emphatic From all this it is of course evident that the bacteriology of rheumatoid arthritis and the exact value of vaccine treatment are subjects for further investigation and it is certain that the necessary inquiries will be actively prosecuted

Differences of opinion on points which yet await the judgement of experience must however not be allowed to minimize or confuse the positive additions which recent observations and study have made to the diagnosis and treatment of the various forms of arthritis Particularly does this proposition apply to the contrast established between rheumatoid arthritis on the one hand and osteo-arthritis on the other for it is here largely that confusion has existed It is no small gain to have a definite nomenclature and classification set up and to know that the division rests not on fancies but on facts The history and clinical examination of the patient make of course their special claim but ancillary methods have a large application Dr Cecil emphasizes the value of blood and joint cultures though he recognizes that the former require an elaborate technique and a considerable time *x*-ray examinations afford a contrast between changes due to infection and those of a degenerative order the blood sedimentation test he regards as of high diagnostic value as also the Schilling haemogram which shows in the presence of an infective process more or less numerous immature polymorphonucleocytes due to the stimulation of the bone marrow by the infective agent By these or other methods the expectation is that the area of confident diagnosis in joint affections will be greatly enlarged with resulting opportunities for prevention and treatment Of course if these ends are to be attained the new knowledge must pass from academic circles into the busy life of practice and there is the more claim to strive for this development in view of the amount of suffering of disability and of economic loss which joint diseases inflict, and in view too of the brighter therapeutic prospects which research has now established It is all to the good that efforts are being made on both sides of the Atlantic to bring the new opportunities into effective operation

RHEUMATIC DISEASES AND HEALTH INSURANCE

The National Federation of Trade Unions Approved Society was in conference at Buxton at the end of last month and discussed many aspects of national health insurance The conference was addressed by Dr C W Buckley on Rheumatic Diseases and their Effect on the Finances of Approved Societies He said that it was by the wise provision and administration of additional benefits that sickness and disability might be lessened and thus in the long run expenditure reduced This principle might be applied with greater force and advantage to the great group of diseases classed as

THE RESIDENTIAL TREATMENT OF ALCOHOLISM & DRUG ADDICTION

RENDLESHAM HALL

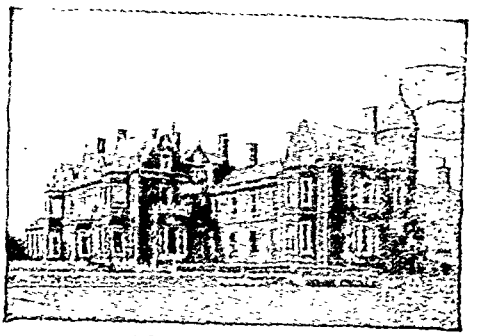
(Postal Address)—WOODBRIDGE, SUFFOLK.

Rendlesham Hall, which is open to receive patients, is essentially a Sanatorium. Its daily life and routine are that of an ordinary comfortable holiday or health resort, or of a large country house. Each patient has all the privileges of a guest consistent with the prescribed medical treatment.

Rendlesham Hall has 45 bedrooms, and about 450 acres of gardens and park. It has also a private nine-hole golf course, tennis and croquet lawns, and bowling green.

Illustrated booklet giving particulars as to terms, etc., can be had on application to the RESIDENT MEDICAL SUPERINTENDENT.

Telegrams and Telephone: Wickham Market 16. *(Toll Call from London.)*



RENDLESHAM HALL

To those desiring to be near London—

The Mansion, Beckenham Park, Beckenham,

as carried on for the last twenty years, is available. Booklets and particulars from the Resident Medical Superintendent.

Telephone: BECKENHAM 1648. *Telegrams:* NOROTORIUM, BECKENHAM.

Proprietors: The Norwood Sanatorium, Limited.

CALDECOTE HALL

Nr. NUNEATON, WARWICKSHIRE.

'Phone. NUNEATON 241.

Particulars may also be had from the Secretary, 40, Marsham Street, London, S.W.1.

ALCOHOLISM, NEURASTHENIA, Etc.
(For Men)

At this beautifully situated country mansion in Warwickshire (2 hrs. from London on L.M.S R.), the residential treatment of Alcoholism, Neurasthenia, Insomnia, and Nervous breakdown is carried out on the most modern principles under the supervision of the Res. Med. Supt. Recreation and graduated occupational therapy are available in the extensive secluded grounds. Prospectus from A. E. CARVER, M.D., D.P.M., Resident Medical Superintendent.

ALCOHOLISM, DRUG HABIT, NEURASTHENIA, etc.

BAY MOUNT, PAIGNTON.

ESTABLISHED 1922. *Phone*: PAIGNTON 5110.

A comfortable private HOME, charmingly situated overlooking Torbay, near Torquay Main line 3½ hours from Paddington. Both Ladies and Gentlemen admitted as voluntary patients. The treatment is the outcome of many years experience, and besides removing all craving for drink and drugs, it has a tonic action on the system, and the general health is improved. Alcohol and drugs reduced gradually, without suffering.

FUNCTIONAL NERVOUS DISEASES AND NEURASTHENIA are also treated with excellent results. Cases with insomnia, depression, etc., do especially well.

Exceptionally good climate and ample and varied amusement. Moderate, inclusive terms Prospectus, etc., from STANFORD PARR, M.B., Ch.B., Res. Med. Supt., Bay Mount, Paignton

ALCOHOLISM & DRUG HABIT

DALRYMPLE HOUSE, RICKMANSWORTH, HERTS.

'Phone: Chislehurst 451. *Telegrams*: "Masters," Chislehurst.

rheumatic than in any other direction, since they were responsible for an enormous drain on industry and consequently on the insurance funds Rheumatic diseases accounted for one-sixth of the total weeks of sickness among insured male workers alone Although much had already been done in the investigation and treatment of rheumatic fever, chronic arthritis was only beginning to receive the attention it deserved, and the public were still not alive to the importance of thorough treatment in the earlier stages , the sufferer often did not give up work until the stage at which treatment was most likely to be successful was past One approved society had, however, quite recently arranged that every case of arthritis occurring among its members should be notified at once to headquarters and made the object of special care and investigation with a view to early and thorough treatment The Ministry of Health had made several important reports on the subject and suggested schemes for dealing with the problem Dr W S C Copeman had amplified and developed a plan for rheumatism advisory centres to which practitioners might refer their cases These centres would be linked up with the in-patient wards of general hospitals, with the spa hospitals, and with physical treatment centres to be established along the lines of the Red Cross Clinic in Regent's Park Such a plan would do much to solve the problem of early and thorough treatment Dr Buckley suggested that the old Poor Law infirmaries, now termed " municipal hospitals," should be utilized largely in this scheme, with a consultant staff, if necessary, along the lines now under consideration by the London County Council to provide for in-patient treatment, and if properly equipped they would also provide the physical treatment centres The rheumatism advisory centres could be arranged as part of the out-patient department of any hospital or as separate clinics along the lines of the existing tuberculosis and venereal disease clinics Since arthritis is common in country districts and small towns where there is no hospital accommodation to permit of adequate development along these lines, it would be expedient to arrange for skilled physical treatment to be administered by members of the Chartered Society of Massage and Medical Gymnastics, under the general directions of the patient's own doctor If such workers could be established in rural districts, preferably in affiliation with the district nursing scheme but paid an adequate salary from a central fund, a very great deal, in Dr Buckley's view, could be done to cope with the problem of the treatment of arthritis While some of the cost must be met from health insurance funds, aid would also be required from public money, either national or local, since not more than half of the sufferers would be insured Some of the remainder would be in a position to pay, and this would help to reduce the cost

Dr Buckley is right when he says that we, in attacking this great problem, are definitely behind some Continental countries which have proved that such a scheme as he outlined is quite practicable There will be general agreement with him, too, in his insistence that research should be encouraged at the same time into the causes of these diseases and their control Much may be expected from slum clearance and better housing Climate he regards as a much less important factor than defective hygiene in the home Stuffy rooms and workshops, unsuitable food and clothing, want of fresh air, and unfavourable working conditions do far more to lower resistance to rheumatic diseases than climate

THE CURABILITY OF CANCER

At the annual congress of the American College of Surgeons in 1932 a feature of the proceedings was an extensive symposium entitled " Cancer is Curable "[1] The series of thirty individual communications composing it deals largely with five-year cures, of which no fewer than 4,348 are reported Eight of these communications deal exclusively with cancer of the uterus and four with cancer of the breast other organs, considered individually as well as in general reports of the results obtained at particular clinics, are the stomach, kidney, bladder, prostate, testis, larynx, eye, and skin No general analysis is feasible, since the reports cover different periods of time and a variety of forms of treatment , nor can the respective merits of such treatments be readily assessed as a whole On the other hand, there can be few surgeons and radiologists who will not find some record or opinion which will be instructive the reports represent present-day practice in most of the leading surgical centres of America, and, besides furnishing the most extensive statistical data of results in cancer yet published, they include expressions of opinion and descriptions of operative technique which may not be familiar Although the comparison of results and the estimation of prognosis in different types of malignant disease furnish the chief advantage of such a symposium, the motive which led in this case to the choice of subject was avowedly propagandist It was felt that, until the public can be brought to believe that cancer is a curable disease, the earlier treatment which is the first requirement for better success is not likely to be secured, and to that end the fullest " ethical " publication of the proceedings was encouraged The extent to which public attitude must control the possibility of successful results was repeatedly emphasized One speaker referred to a legal acquaintance sceptical of the possibility of any cure of cancer who, unknown to himself, had had a carcinoma of the sigmoid flexure removed fifteen years previously No doubt a considerable proportion of patients from whom malignant growths have been successfully removed are never told the nature of the condition , if they are, the prevalent reaction to the word " cancer " is such that they will be highly reluctant to speak of it The consequence is that successes tend to be obscured, while examples of failure (" poor So-and-so had cancer ") are known to everyone This obstacle to a more enlightened public opinion is a very real one, and not likely to be easily overcome Apart from any indirect effect on the public, however, it was naturally hoped that the profession itself, and in particular those who have possibly been discouraged by a series of unsuccessful cases, might be convinced of the value of modern methods of treatment Not only the diagnostic ability and promptitude of the practitioner first seeing a case, but a conviction on his part of the utility of appropriate measures, are at least as much a *sine qua non* as the seeking of early advice A plea was also made for the advanced case,

[1] *Surg. Gynecol. and Obstet.* 1933, lvi, 412

ST. ANDREW'S HOSPITAL

FOR MENTAL DISORDERS,

NORTHAMPTON.

FOR THE UPPER AND MIDDLE CLASSES ONLY.

President: THE MOST HON. THE MARQUESS OF EXETER, C.M.G., A.D.C.

Medical Superintendent: DANIEL F. RAMBAUT, M.A., M.D.

This registered Hospital is situated in 120 acres of park and pleasure grounds. Voluntary patients, who are suffering from incipient mental disorders or who wish to prevent recurrent attacks of mental trouble, temporary patients, and certified patients of both sexes, are received for treatment. Careful clinical, biochemical, bacteriological, and pathological examinations. Private rooms, with special nurses, male or female, in the Hospital or in one of the numerous villas in the grounds of the various branches can be provided.

WANTAGE HOUSE.

This is a Reception Hospital in detached grounds, with a separate entrance, to which patients can be admitted. It is equipped with all the apparatus for the most modern treatment of Mental and Nervous Disorders. It contains special departments for hydrotherapy by various methods, including Turkish and Russian baths, the prolonged immersion bath, Vichy Douche, Scotch Douche, Electrical bath, Plombières treatment, etc. There is an Operating Theatre, a Dental Surgery, an X-ray room, an Ultra-violet Apparatus, and a Department for Diathermy and High Frequency treatment. It also contains Laboratories for biochemical, bacteriological, and pathological research.

MOULTON PARK.

Two miles from the Main Hospital there are several branch establishments and villas situated in a park and farm of 650 acres. Milk, meat, fruit, and vegetables are supplied to the Hospital from the farm, gardens, and orchards of Moulton Park. Occupation therapy is a feature of this branch, and patients are given every facility for occupying themselves in farming, gardening, and fruit-growing.

BRYN-Y-NEUADD HALL.

The seaside house of St. Andrew's Hospital is beautifully situated in a Park of 330 acres, Llanfairfechan, amidst the finest scenery in North Wales. On the North-West side of the Estate a mile of sea coast forms the boundary. Patients may visit this branch for a short seaside change or for longer periods. The Hospital has its own private bathing house on the seashore. There is trout-fishing in the park.

At all the branches of the Hospital there are cricket grounds, football and hockey grounds, lawn tennis courts (grass and hard courts), croquet grounds, golf courses, and bowling greens. Ladies and gentlemen have their own gardens, and facilities are provided for handicrafts, such as carpentry, etc.

For terms and further particulars apply to the Medical Superintendent (Telephone No. 2356 and 2357 Northampton), who can be seen in London by appointment.

HAYDOCK LODGE,

NEWTON-LE-WILLOWS, LANCASHIRE.

'Phone: 11 Ashton-in-Makerfield.

For the reception and treatment of PRIVATE PATIENTS of both sexes of the UPPER AND MIDDLE CLASSES suffering from mental and nervous diseases, either voluntarily or under Certificate. Patients are classified in separate buildings according to their mental condition.

Situated in park and grounds of 400 acres. Self-supported by its own farm and gardens, in which patients are encouraged to occupy themselves. Every facility for indoor and outdoor recreation. For terms, prospectus, etc., apply MEDICAL SUPERINTENDENT.

THE COPPICE, NOTTINGHAM.

HOSPITAL FOR MENTAL DISEASES.

This Institution is exclusively for the reception of a limited number of Private Patients of both sexes of the Upper and Middle Classes at moderate rates of payment. It is beautifully situated in its own grounds on an eminence a short distance from Nottingham, and from its singularly healthy position and comfortable arrangements affords every facility for the relief and cure of those mentally afflicted. Voluntary and Temporary Patients received.

Tel. 64117. *For terms, etc., apply to the Medical Superintendent.*

COURT HALL, KENTON, EXETER,

SOUTH DEVON.

For the care and treatment of Ladies suffering from Mental Diseases. Limited to eight patients. Telephone: Starcross 59.

CLIFFDEN, TEIGNMOUTH, in connection with Court Hall, for early and convalescent cases. Cliffden is a large well-appointed house, with lovely views of the South Devon Coast. It is beautifully situated in grounds of 24 acres. The gardens are very attractive, and there is a private road to the beach.

Resident Physicians: BERTHA M. MULES, M.D., B.S.; ANNIE S. MULES, M.R.C.S., L.R.C.P.

Telephone: Teignmouth 289.

TYKEFORD ABBEY, NEWPORT PAGNELL,

BUCKS.

FUNCTIONAL NERVOUS DISORDERS, MEDICAL & CONVALESCENT CASES.

An Approved Nursing Home for reception of Female Cases under the Mental Treatment Act.

The Home is a Mansion of Historical interest, standing in 9 acres of garden and grounds, and is situated 14 miles from Northampton, and 12 miles from Bedford on the main London to Northampton Road, fifty miles from London. Both sexes are accommodated. Psycho-therapeutic Treatment is used extensively in suitable cases. Radiant Heat, X-Ray, and Ultra-violet Light. Diathermy and Foam Baths. Billiards, tennis, etc. Fees from five gns. per week.

Apply, Dr. D. E. M. DOUGLAS-MORRIS. Telephone: Newport Pagnell 121.

CHISWICK HOUSE

A Private Mental Hospital for the Treatment and Care of Mental and Nervous Disorders in both Sexes.

Now removed to

CHISWICK HOUSE, PINNER, MIDDLESEX

Telephone: PINNER 234

A modern country house, 12 miles from Marble Arch, in beautiful secluded grounds. Fees from 10 guineas per week, inclusive. Cases under certificate and Voluntary Patients received for treatment. Special provision for "Temporary" patients under the new Mental Treatment Act.

Douglas Macaulay, M.D., D.P.M.

BARNWOOD HOUSE,

GLOUCESTER.

A REGISTERED HOSPITAL for the CARE and TREATMENT of LADIES and GENTLEMEN suffering from NERVOUS and MENTAL DISORDERS. Within two miles of the G.W. Railway and L.M. & S. Railway Stations at Gloucester, the Hospital is easily accessible by rail from London and all parts of the United Kingdom. It is beautifully situated at the foot of the Cotswold Hills, and stands in its own grounds of over 280 acres. Voluntary Boarders of both sexes are also received for treatment.

Special accommodation for Lady Voluntary Boarders is also provided at the MANOR HOUSE, which has its own private grounds and is entirely separate from the main Hospital.

For particulars as to terms, etc., apply to—
ARTHUR TOWNSEND, M.D., Medical Supt.
Telephone: No. 7 Barnwood.

FENSTANTON,

CHRISTCHURCH ROAD,

STREATHAM HILL, S.W.2.

A Private Home for the Care and Treatment of a limited number of Ladies with Mental and Nervous Disorders. Separate accommodation for Voluntary Patients. Large Mansion with 12 acres of ground. BROOKE HOUSE,

CLAPTON, LONDON, E.5.

Telephone: Clissold 1648.

PRIVATE HOSPITAL for Ladies and Gentlemen suffering from Mental and Nervous Disorders. The hospital is situated in nine acres of pleasure grounds. Both voluntary and patients under certificates received. For further particulars apply Dr. GERALD JOHNSON and Dr. ERNEST ROLLINS, Resident Physicians.

SPRINGFIELD HOUSE,

Near BEDFORD. (Phone 3417.)

For Mental Disorders with or without Certificates.

Resident Physician: CEDRIC W. BOWER.

Ordinary Terms: Five Guineas per week.

(Including Separate Bedrooms where suitable.)

Interviews in London by appointment.

not merely on the ground that unexpected success may follow radical treatment but in the sense that palliative relief should continue to be afforded by all possible means there is a quack waiting round the corner for every patient whose doctor gives him up There is a remarkable degree of unanimity in the opinions expressed in these reports and their conclusions appear wholly applicable to the same problems in any country

ASSESSMENT OF CLIMATIC FACTORS

One of the Sections at the recent annual congress of the Royal Institute of Public Health at Eastbourne—that concerned with hydrology and climatology—provided a common ground for members of the medical profession and meteorologists and was presided over by Sir Gilbert Walker, professor of meteorology at the Imperial College of Science and Technology South Kensington Sir Gilbert Walker whose presidential address was entitled 'Airs Waters and Places devoted himself to a discussion of the methods of assessing climatic factors in their influence upon disease Of the two methods of proceeding one being to consider the locality and note the effect of varying amounts of rainfall (if that is the climatic factor taken) in successive years upon the extent of the disease and the other to consider a number of places and observe the extent of reaction upon the disease of localities wet and dry he thought the first method the simpler though it required assistance from the second The second method was the more usual practice but it was open by itself to serious objection for there were other respects than rainfall in which places would vary and while the assessment might be easy enough with quantitative factors like sunshine humidity and wind it was not easy with such matters as soil or with the effects of cheerful surroundings and attractive scenery It seemed to him therefore that the second method that of comparing the results of different rainfall experienced in a number of places was only of value in suggesting a working hypothesis to which the first method could be applied Sir Gilbert Walker instanced some precautions to be taken in using statistical methods Although such methods gave the degree of association between different factors they alone could not indicate which was cause and which was effect It had long been known for example that places of abundant tree growth were places of abundant rainfall and while some had deduced that more rain produced more trees others had deduced that it was the forests that produced the rain Clearly the question could only be settled by specialized knowledge Again false inferences might be made unless care was taken that all the relevant factors were included in the examination Useful information as to whether a given factor was a cause or an effect of another factor could sometimes be derived by trying the effect of a change in the epochs in which the two factors were measured It was always the choice of the factors to be examined which made specialized knowledge absolutely necessary and without it the expert in statistical methods was gravely handicapped Indeed he was liable to produce what might seem conclusive evidence of a relationship of cause and effect which in reality did not exist

PREVENTION OF BLINDNESS IN INDIA

The Junior Section of the Indian Red Cross (New Delhi) has published a pamphlet of fourteen pages setting out the salient measures needful for the layman to know for the prevention of blindness It is stated that there are in India about one million blind persons and for each blind person there are three others with seriously impaired sight who are blind in one eye or have some eye disease which seriously impairs their vision A large number of blind persons might recover their sight by having proper medical treatment But a much larger number of people ought never to have gone blind because blindness can be avoided in most cases Simple measures are enough to prevent people from losing their sight as well as to protect the eyes of young children With this introduction the pamphlet gives a series of short clear statements of eight dangerous conditions keratomalacia and night blindness syphilis and gonorrhoea trachoma small-pox the use of dangerous and irritant drugs by quacks and irritation due to dust and dirt baby's sore eyes accidents squint and short sight Each of these sections is written in the clearest of language and there are illustrations which point the moral even more effectively than the printed word Finally, there is a summary in the form of fifteen commandments, the first of which reads

Keep your hands and face clean Wash them thoroughly with soap and clean water at least twice daily The authors of the pamphlet are to be commended for their work and the Red Cross Society for its enterprise in undertaking the publication

SOCIALIZATION OF THE MENTALLY DEFECTIVE

It would be well if all the members of the British Medical Association's special committee on mental deficiency and many of those influenced by its report would continue to draw attention from time to time to the important findings and conclusions contained in that report An admirable example of the way in which this may be done is found in a pamphlet by Dr Henry Herd school medical officer for Manchester and one of the members of the committee[1] It is a reprint of an address given to the North Lancashire Association for Mental Welfare and is largely based upon the third section of the report of the B M A committee What is meant by the socialization of the mentally defective needs expounding and some popular ideas with regard to the relation of such a process to segregation on the one hand and sterilization on the other need correcting In this pamphlet Dr Herd both expounds and corrects very effectively and it is well worth reading by all those interested Most of the points made will be familiar to those whose knowledge of the subject is fairly extensive especially if it is the result of practical experience in dealing with mentally defective children Attention may be drawn particularly to two of those which Dr Herd's address contains He quotes an American writer who almost paraphrasing a sentence in the B M A report says In considering what class of feeble-minded individuals may safely remain in and may be returned to the community it is of more importance to study what

[1] Beeley Bros Penny Street, Lancaster

communities are safe for the feeble-minded " Again, in Dr Herd's own words " In the average stable, docile type of defective, modifiability is markedly possible His suggestibility can be his salvation, though it can also be his curse Indeed, such a type is exceedingly sensitive to influences around him, and if these influences are good he may become a fairly steady, reliable personality " In this connexion the observations of the Ministry of Health on the paragraphs of the report of the Ray Committee dealing with the care of the mentally defective may be recalled The departmental circular to local authorities says " Neither the Board of Control nor the Minister could subscribe to the view expressed that there is no evidence that more than a negligible number of the mentally deficient are improved in condition by treatment The effect of the experience obtained is, in fact, that all but a negligible number show improvement after treatment, both as regards habits, behaviour, and capacity for work "

AN EARLY DIETETIC PHYSICIAN

Professor Raymond Pearl has recently called attention to Toby Venner and his *Via Recta* [1] Tobias Venner was the son of a gentleman in Somersetshire He was born in 1577, matriculated at Oxford from St Albans Hall in 1595, practised first at Bridgewater, afterwards at Bath, and died in 1660 He wrote the *Via Recta ad vitam longam*, or a treatise wherein is the right way and best manner of living for attaining to a long and healthful life The fourth and final impression was published in 1660, and has a fine portrait of the author, aet su 85, executed by Faithorne Professor Pearl points out that Venner's recommendations as to diet are curiously modern in character, and that without knowing it he was recommending foods rich in vitamins He writes of the dietary virtues of lettuce, milk, egg-yolk, and of the use of bran for those who are costive Cream he thinks is " hurtful to them that be phlegmatic and to old men, but unto young men that have strong stomachs it is (especially in the hot seasons of the year) no less convenient than delightsome , and verily with Straw-berries and Sugar, it is for them, for whom it is convenient, a very delicate and wholesome dish And whosoever he be that delighteth to eat a dish of cream, let him not be parsimonious of sugar, for that is the best correctory for it " Appended to the paper is an interesting diagram which Professor Pearl calls a " biogram," showing Venner's relation to contemporary writers at different periods of his life To the scanty notices of Venner may be added the short article which appeared in the *Hospital* on February 4th, 1905, because it shows that a remarkable personality has not been wholly overlooked by his fellow countrymen Toby also wrote a *Treatise on Tobacco*, which he says " very many in these days doe too licenciously use " He was no friend to its use, for he says, " It drieth the brain, dimmeth the sight , vitiateth the smell, dulleth and dejecteth both the appetite and stomach, destroyeth the concoction disturbeth the humours and spirits, corrupteth the breath, induceth a trembling of the limbs, exciccateth the windpipe, lungs and liver, annoyeth the milt, scorcheth the heart, and causeth the blood to be adusted Moreover it eliquateth the pinguie substance of the kidnies and absumeth the genture In a word it overthroweth the spirits, perverteth the understanding and confoundeth the senses with a sudden astonishment and stupidity of the whole body " Nevertheless if men must smoke it should be " Virginia tobacco and not Verinus or Spanish Tobacco, for the best sort of Virginia tobacco in comparison with the latter is weak, yet it is of reasonable good relish and is best for them that love to play with Tobacco's smoke or know not how to pass the time without a Tobacco pipe in their hands "

[1] *Human Biology* vol iv, No 4 Baltimore Johns Hopkins Press

FROM HATS TO HANDWRITING

A reader in South Southumberland, who liked the " general tone " (as he is kind enough to put it) of our recent note on Hats and Stethoscopes, wishes to " nail a lie to the counter " (as he is unkind enough to put it) He is the son of a doctor and the grandson of a doctor, and neither his father nor his grandfather—all honour to them—ever wore a high silk hat , they covered their heads with " a high square bowler, something betwixt and between " Our correspondent has caught us out here We should have remembered that intermediate nameless kind of hat which combined the professional decorum of the topper with the all-weather qualities of the billycock Did not Mr Churchill attempt to revive it? But the point we wish to make now is that our critic writes illegibly and on both sides of his notepaper, with scarcely any space between the lines and no margins This fourfold literary crime is all too common It is not peculiar to South Southumberland , it is committed by otherwise blameless practitioners in West East Anglia and even in Mid-Middlesex The illegibility for which doctors are notorious has been attributed to note-taking at lectures and the constant scribbling of " rep mist " We think it has deeper origins Did not learned psychologist Dogberry say that to write and read comes by nature? A vile fist may be hereditary in some families or it may be over compensation for an emotional trauma in babyhood On the other hand, there are medical authors who seem, with Hamlet, to hold it a baseness to write fair Sir Clifford Allbutt was not of that opinion, though his MSS and his corrected proofs were often a sore trial to editors and printers So difficult did his " copy " become that none but the most experienced compositor could be trusted to handle it But Sir Clifford was disarmingly ashamed of his MS , and had the grace to write on one side only of the paper It is told of a judge that he kept on saying, " I cannot hear you, Mr X," to a young counsel who had forgotten to put on his wig and who repeated the same opening words crescendo in the belief that his lordship was deaf So, too, there was once a medical editor who, after frowning long over an illegible MS , flung it back to its author with the remark, " Take this to the chemist , I can't dispense it "

The Societe Internationale de Chirurgie Orthopédique, whose president is Professor Nové-Josserand of Lyons, will hold its second congress in London from July 19th to 22nd

RUTHIN CASTLE, NORTH WALES

REDUCTION OF FEES

In view of the present economic position, the inclusive fees at Ruthin Castle, formerly from 17 guineas a week, have been reduced to from 15 guineas a week.

The fees include medical attendance, all scientific investigations that may be needed, such as analyses, bacteriological cultures, the ordinary x-ray examinations, and electrocardiograph readings; all treatment that may be prescribed, such as special diets, insulin, artificial sunlight, electrical treatment, baths, massage, nursing; medicines or vaccines, board, and lodging.

The only extra charge is that for a complete alimentary x-ray examination, or for x-ray therapy.

Many people who would go abroad for health will not do so this winter. All the usual forms of treatment are given at Ruthin Castle. The climate is mild. The annual rainfall is 30.5 inches, that is, less than the average for England. There is central heating throughout. Should the accommodation in the Castle not prove sufficient, comfortable rooms can be obtained near by for those undergoing treatment.

Address—THE SECRETARY, Ruthin Castle, North Wales. Telegrams: CASTLE, RUTHIN. Telephone: RUTHIN 66.

WOODSIDE HOSPITAL

WOODSIDE AVENUE, MUSWELL HILL, LONDON, N.10

President: THE RT. HON. THE EARL OF ATHLONE, K.G., P.C.

Fully equipped with every modern appliance for the diagnosis and treatment of

FUNCTIONAL NERVOUS DISORDERS

Private Rooms, Broad Verandahs, Physiotherapy and Psychotherapy, X-ray and Dental departments, Laboratories for investigation and research. For terms and particulars apply to the Physician in charge at the Hospital. Telephone: Tudor 4211.

CHEADLE ROYAL MENTAL HOSPITAL,

CHEADLE, CHESHIRE.

This REGISTERED HOSPITAL, with a SEASIDE BRANCH at Colwyn Bay, N. Wales, is for the treatment and care of those of the Upper and Middle Classes suffering from MENTAL and NERVOUS DISEASES.

The Hospital is governed by a COMMITTEE, appointed by the TRUSTEES of the Manchester Royal Infirmary.

In addition to the Main Building there are separate villas. Extensive grounds. Hard and grass tennis courts, cricket and croquet grounds, and a court for badminton. There are also wireless installations. Golf may be had within easy distance. Occupational Therapy.

VOLUNTARY, TEMPORARY, AND CERTIFIED PATIENTS received.

The Hospital is nine miles from Manchester, 50 minutes by rail from Liverpool, and 3½ hours from London.

For terms and further particulars apply to the Medical Superintent, J. A. C. ROY, M.B., who may be seen in Manchester by APPOINTMENT.

Telephone: GATLEY 2231 (3 lines).

CAMBERWELL HOUSE, 33, Peckham Road, London, S.E.5.

Telegrams: "PSYCHOLIA, LONDON." FOR THE TREATMENT OF MENTAL DISORDERS. *Telephone*: RODNEY 4731—4732.

Also completely detached Villas for mild cases, with private suites if desired. Voluntary Patients received. Twenty acres of grounds. Hard and Grass Tennis Courts, Putting Greens, Bowls, Croquet, Squash Rackets, and all indoor amusements, including Wireless and other Concerts. Occupational Therapy, Callisthenics, and Dancing Classes, X-ray and Actino-therapy, Prolonged Immersion Baths, Operating Theatre, Pathological Laboratory, Dental Surgery, and Ophthalmic Dept. Chapel. Senior Physician: Dr. HUBERT JAMES NORMAN, assisted by three Medical Officers, also resident and visiting Consultants.

An illustrated Prospectus, giving fees which are strictly moderate, may be obtained upon application to the Secretary.

The Convalescent Branch is HOVE VILLA, BRIGHTON, and is 200 feet above sea-level.

NORTHUMBERLAND HOUSE,

GREEN LANES, FINSBURY PARK, N.4.

Telegrams: "SUBSIDIARY, LONDON." *Telephone*: NORTH 0888.

A PRIVATE HOME for the treatment of patients of both sexes suffering from Mental Illnesses. Conveniently situated four miles from Charing Cross. Easy access from all parts. Six acres of ground highly situated, facing Finsbury Park. Private Suites. Voluntary Patients and Temporary Patients received without certification.

Convalescent Home, Kearsney Court, Dover. For further particulars, apply to the Medical Superintendent.

PECKHAM HOUSE, 112, Peckham Road, London, S.E.15.

Telegrams: "Alleviated, London." Telephone: Rodney 4741-4742.

The above House, which was established in 1826, is an Institution for the care and treatment of persons suffering from mental diseases and nervous disorders. Certified voluntary and temporary patients are received. Separate houses for treatment and accommodation of special cases adjoin the Institution. There is a seaside branch, Kearsney Court, near Dover, to which patients may be sent for treatment or on holiday. Motor and carriage exercise is provided as required. Patients can avail themselves of a course of physical drill. Tennis Courts. Entertainments, dances, and indoor amusements held throughout the year. Terms from £3 3s. per week.

Illustrated prospectus and further particulars can be obtained from the MEDICAL SUPERINTENDENT.

THE OLD MANOR SALISBURY

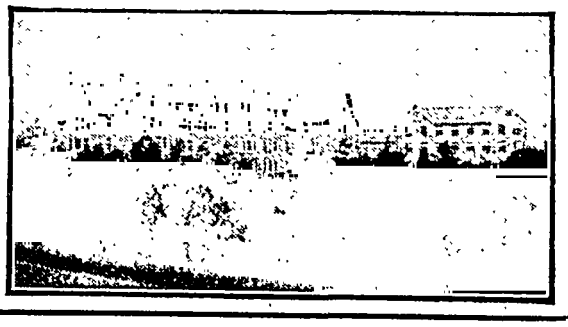
A Private Hospital for the Care and Treatment of those of both sexes suffering from MENTAL DISORDERS.

Extensive grounds. Detached Villas. Chapel. Garden and dairy produce from own farm. Terms very moderate.

CONVALESCENT HOME at BOURNEMOUTH. Detached Villas standing in 12 acres of ornamental grounds, with tennis courts, etc., which Voluntary, Temporary or Certified Patients may visit, by arrangement, for long or short periods.

Illustrated Brochure on application to the Medical Superintendent, The Old Manor, Salisbury. Telephone 51.

TOR-NA-DEE SANATORIUM
MURTLE DEESIDE ABERDEENSHIRE



Medical Director: David Lawson, M.D., F.R.S.E.

FULLY EQUIPPED WITH EVERY MODERN APPLIANCE FOR THE DIAGNOSIS AND TREATMENT OF ALL FORMS OF TUBERCULOSIS AND ALLIED DISEASES

Physician Superintendent. J. M. JOHNSTON, M.B., D.P.H., etc.

Full particulars and Prospectus on application to the Secretary.

Inclusive Terms: SEVEN GUINEAS A WEEK.

The MUNDESLEY SANATORIUM

The newly opened central building makes the Mundesley Sanatorium the best equipped building in England for the cure of Tuberculosis. All the bedrooms have hot and cold running water, electric light, and wireless headphones. The new public rooms are spacious and comfortable.

Resident Physicians:
S. VERE PEARSON, M.D.(Cantab.), M.R.C.P.(Lond.).
ANDREW MORLAND, M.D.(Lond.), M.R.C.P.
E. C. WYNNE-EDWARDS, M.B.(Cantab.).

For all information apply:
THE SANATORIUM, MUNDESLEY, NORFOLK.
(Telephone: Mundesley 4.)

The buildings face S.S.W. and are sheltered from the sea by a pine-clad ridge. The sunshine record and dry air complete a perfect site. The medical equipment is of the latest kind, and there is a day and night nursing staff.

TERMS FROM 7½ GUINEAS WEEKLY.

NORDRACH-UPON-MENDIP SANATORIUM

FOR THE TREATMENT OF TUBERCULOSIS, was opened in January, 1899, by ROWLAND THURNAM, M.D.

All modern forms of treatment are available. There are X-ray and ultra-violet ray installations. Full day and night nursing staff. The Sanatorium stands in gardens and private grounds of 65 acres, at an altitude of 802 feet above sea-level, surrounded by woods and moorland. All rooms are heated by hot-water pipes and electrically lighted.

Fees 4, 5, and 6 guineas per week.

CYRIL FRANCIS ASHBY, M.R.C.S., L.R.C.P., Certificate of Sanatorium Stephani, Switzerland, *Resident Medical Supt.*
For full particulars apply to *The Secretary*, Nordrach-upon-Mendip, Blagdon, Bristol. *Telegrams*: Nordrach Blagdon. *Telephone*: Blagdon 25

THE COTSWOLD SANATORIUM

First opened in 1898 and rebuilt in 1925. On the Cotswold Hills, seven miles from Cheltenham, for the treatment of Pulmonary and all other forms of Tuberculosis. Aspect S.S.W., sheltered from North and East, elevation 800 feet. Pure bracing air. Special Treatment by artificial Pneumothorax (X-ray controlled), Tuberculins, Medicated Inhalations by means of the Apneu Inhalation Installation, and Ultra-Violet Rays is available, when necessary, without extra charge. X-ray plant. Electric light. Radiators, hot and cold basins, and Wireless in all rooms.

Full day and night Nursing Staff.

Medical Superintendent: GEOFFREY A. HOFFMAN, B.A., M.B., T.C.Dub. *Assistant Physician*: MARGARET A. HARRISON, M.B., B.S.Lond.
Consulting Laryngologist: SIDNEY BERNSTEIN, M.R.C.S.Eng., L.R.C.P.Lond. (Attends Regularly.)
Apply: The Secretary, The Cotswold Sanatorium, Cranham, Gloucester. *Telephone*: 41 WITCOMBE. *Telegrams*: "HOFFMAN, BIRDLIP."

Electric light throughout. Fully equipped in shelters. Central heating. Fully equipped X-ray Plant. Inoculation Treatment available. Private patients—24 beds. Trained Nurse on duty day and night. Terms £4 7s. 6d. to £6 6s. per week. No extras. Med. Supt.—FELIX SAVY, M.D.
For particulars apply to the Secretary.

KING EDWARD'S HOSPITAL FUND

The Prince of Wales presided over the annual meeting of the General Council of King Edward's Hospital Fund for London and read a message from the King congratulating the Fund on the fact that the whole of the increased distribution of £300 000 had been covered by the income of the year

PRESIDENT'S SPEECH

The Prince remarked that this achievement was little short of a miracle In spite of the financial crisis and the very serious time through which the country was passing the King's Fund and the voluntary hospitals had had a successful year in 1932 as indeed they had had for some years past By the end of 1931 they had been able to increase gradually the ordinary distribution to £275 000 and to keep also a margin in reserve partly for maintaining the distribution and partly to provide for the special grants in aid of the pensions scheme for nurses and hospital officers In 1932 the income had again reached the same level There was reason to fear that some hospitals might be suffering seriously from the crisis and it was therefore decided to make an immediate increase in the distribution bringing it up to £300 000 After withdrawing also from the year's income the proper share (£20 000) for 1932 for the pensions reserve fund there was left a balance in hand of £111 The distribution of this sum of £300 000 constituted a new landmark in the history and progress of the King's Fund at a level which it was hoped would be maintained As a whole the hospitals did better themselves in 1932 than in 1931 and for the sixth year in succession had come out with a margin on the right side —a narrow margin but slightly better than that of a year ago This was due said the Prince to sustained efforts on the part of individual hospitals and to steady and continuous support on the part of the public Hospital expenditure had been reduced substantially although the total number of beds available had continued to increase New supporters had come forward and a better standard of propaganda work had been reached Hospitals had purchased 50 000 copies of the King's Fund publicity manifesto and had circulated them in support of their own appeals Moreover the miniature hospital had proved very useful in bringing home to people generally the reason why modern hospitals cost so much to build equip and maintain and how great was their efficiency This exhibit was now being shown in the country to benefit local hospitals

OTHER KING'S FUND ACTIVITIES

The Parliamentary Committee of the King's Fund was co-operating with the British Hospitals Association in pressing for recognition of the just claims of hospitals for fair remuneration in connexion with the treatment of motor accident cases the cost of which was at present falling largely on funds contributed for other purposes The staff of the King's Fund had also assisted the London Voluntary Hospitals Committee in the very valuable survey of medical and surgical services in the county of London which that committee had recently issued jointly with the London County Council His Royal Highness believed that this was the first occasion of there being a complete survey made of both parts of these services—namely those provided by the voluntary agencies and those provided by the public authorities The Out patient Arrangements Committee had been considering the recommendations made by Lord Onslow's Committee in respect of standard forms of doctors letters and hospital time tables for out patients In the first case the action being taken by medical organizations was highly commendable and in the second case the hospitals were already co-operating with Sir John Rose Bradford's Committee Records of the time taken in the various stages of out patient treatment were being compiled The Prince added that after dealing with the problem of reducing the time of waiting for patients the Arrangements Committee proposed to study the possibility of time saving methods at the dispensary stage This seemed to him a very reasonable objective because any improvements found desirable here could be brought into operation without disturbing the rest of the out patient procedure

With the increasing activities of the King's Fund larger and more convenient office accommodation had become necessary and had been obtained The figure for expenses came to 10½d in the pound of the amount received This said the Prince covered more than the cost of collecting and distributing £320 000 among 180 hospitals and convalescent homes and obtaining and studying all the necessary information It included also the cost of performing many of the functions of a central body acting for the voluntary hospitals of almost the whole of Greater London which had between them an annual turnover of nearly £4 000 000

THE 1932 ACCOUNTS

Proposing the adoption of the accounts for 1932, the honorary treasurer Mr E R Peacock explained that these had become rather complicated owing to the fact that the Fund had been asked by some donors to act as trustee for them in allocating their gifts There would now be an income and expenditure account dealing only with the general income the expenses and the distribution receipts for special purposes being dealt with in the balance sheet. Among the receipts he mentioned the increased contribution of £20 000 from the League of Mercy the further £10 000 from the British Charities Association and legacies which were again nearly £60 000 As the result of the bequest to the King's Fund of the residuary estate of the late Lord Mount Stephen the capital would now receive an addition of about £150 000 and a further sum when certain annuities ceased The amount received annually in voluntary contributions had recently averaged £140 000 If the distribution was to be maintained at its present level this amount should be increased

TWENTY-SEVENTH SOUTH AFRICAN MEDICAL CONGRESS

TRAVEL FACILITIES

In connexion with the twenty seventh South African Medical Congress to be held at Capetown from September 25th to 30th 1933 the following announcement is made for the benefit of those who contemplate undertaking the journey

A special concession of 20 per cent. in the ordinary fare to Capetown has been granted by the Union Castle Mail Steamship Company and Messrs Ellerman and Bucknall Ltd Members taking advantage of this concession are required on booking passages to produce a certificate of membership which can be obtained on application to the Medical Secretary British Medical Association House Tavistock Square London W C 1

Those whose time is limited are advised to travel by R M S *Balmoral Castle* leaving Southampton on September 8th arriving at Capetown on Monday September 25th at 6 a.m in good time to be present on the opening day of Congress and returning by the R M S *Windsor Castle* leaving Capetown at 4 p m on Friday September 29th arriving at Southampton on October 16th

Special excursion rates (first class £90 second class £60 third class £30 not subject to further concession) are available by the R M S *Windsor Castle* sailing from Southampton on August 25th returning from Capetown either on September 29th by the same vessel or on October 6th by the R M S *Warwick Castle*

For those who prefer the longer sea voyage there are convenient sailings by the intermediate ships of the Union Castle Line and those of the Ellerman and Bucknall Line Full particulars about sailings and further information may be obtained from any of the offices of Messrs Thomas Cook and Son who will be able to make inclusive travel arrangements for the return journey including hotel accommodation Special terms will be granted by most of the important hotels in Capetown

A limited amount of accommodation is available at the University residences Groote Schuur where Congress will meet for the period September 25th to 29th Inclusive tariff will not exceed 10s 6d per diem Immediate application should be made to the honorary organizing secretary Twenty-seventh South African Medical Congress P O Box 643, Capetown by those who wish for this accommodation

Members proposing to attend the Congress are requested to communicate with the honorary organizing secretary at the above address as soon as possible stating by what steamer they are travelling and whether they will be accompanied by lady guests so that arrangements can be made for their reception

The director of the Publicity and Travel Bureau in the Office of the High Commissioner for South Africa in London offers the services and facilities of his bureau in respect of any rail journeys which members may undertake during their stay in South Africa Those who wish to take advantage of this offer of assistance should communicate with the officer in charge Tourist and Travel Bureau South Africa House, 79 Strand, W C 2, where full information about any journey they desire to undertake in the Union of South Africa or in Rhodesia will be gladly furnished

LONDON AND COUNTIES MEDICAL PROTECTION SOCIETY

The annual meeting of the London and Counties Medical Protection Society was held at Victory House, Leicester Square on May 31st

Sir John Rose Bradford who presided said that during the year the work of the society had largely increased The membership had also received a welcome addition of 861 against which had to be set a loss of 422 by death resignation and removal It was still remarkable how many members of the medical profession to their obvious risk remained outside the defence societies and how many joined long after qualification The legal expenses had been high owing to costs and damages awarded in certain cases but, on the whole the year had been a successful one both in respect to favourable decisions obtained in the courts and to satisfactory settlements outside In two notable cases in which the society had not been successful it had had justification for thinking from the narrow medical point of view that it ought to have been The layman's mind to say nothing of the legal mind regarded some of these problems of differential diagnosis or surgical treatment from a different angle from the medical profession Sir John Rose Bradford added that it was curious to note how in different periods there occurred a series of cases of the same class A little while ago numerous cases were brought forward in which fractures had been overlooked owing to the absence of a proper x ray examination During the last year there had been a remarkable series of cases of accidents following dental extractions Some of these had been satisfactorily settled in others the settlement had not been so satisfactory Finally he referred to the loss which the society had sustained in the death of two of its members of council—Dr Owen Fowler and Mr Bayford Underwood

Dr R L Guthrie presented the financial statement which showed that the invested funds had a book value of £52,500 and that the market value had appreciated by £8 000 in a year The cost of the society was £1 0s 10½d per member

Sir John Rose Bradford was re elected president Dr Guthrie treasurer and Dr C M Fegen secretary, all the vice presidents were also re elected, with the addition of Mr F J Steward and the meeting concluded with a number of votes of thanks In proposing one of these resolutions Dr C O Hawthorne suggested that the society's annual report should be sent to every teacher of forensic medicine throughout the country Such teachers would there find, he said the narrative of various experiences which they could place before their students to illustrate the application of medical jurisprudence in practice Dr Fegen replied that the report was already circulated to every person on the *Register* who was resident in the British Isles and copies were also sent to every medical school

The solicitors to the society (Messrs Le Brasseur and Oakley) in reporting on a selection of the cases which came forward during the year mentioned what seemed to be the increasing custom of certain judges of intervening in the hearing of a case and endeavouring to bring the parties to a settlement In some cases it was felt this might create considerable embarrassment to one side in declining the good offices of the learned judge It had to be remembered however that a judge had a unique experience in gauging the strength of a case and in forming an opinion as to the manner in which the mind of the jury might be made up Though it might be better if there was never any intervention it was that human touch in British judicial proceedings which made them a model to the world It was mentioned that the number of applications for advice and assistance from members during the year was 1 264 and the number of cases actually brought to trial in the courts was greater than in any preceding year

W E DIXON MEMORIAL

A meeting of subscribers to the W E Dixon Memorial Fund was held at the Royal Society of Medicine on June 1st, under the chairmanship of Sir William Willcox, who referred to the lamented death of Professor Walter E Dixon on August 16th, 1931, and said how keenly it was felt by his colleagues, friends, and students that some memorial to him should be established

A small executive committee was formed in December, 1931, consisting of Sir Humphry Rolleston, Lord Dawson of Penn, Professor W Langdon Brown, Dr Alfred Cox, Dr Eric Holmes, Dr J Clifford Hoyle, and Sir William Willcox After much thought and discussion it was considered that the best form which the memorial should take would be a lecture on some subject of pharmacological or therapeutic interest Mrs Dixon was consulted and heartily concurred in the proposal, being of opinion that no better form of memorial could be chosen

The executive committee appointed Sir William Willcox as chairman, Professor Langdon Brown as treasurer and as honorary secretaries Dr Eric Holmes and Dr Clifford Hoyle Several meetings of the executive committee were held in London and at the meeting on March 22nd last it was decided that the fund should be closed on May 1st It was resolved that a general meeting of subscribers be held on June 1st, when a recommendation would be brought forward by the committee that the fund be devoted to the establishment of a "W E Dixon Memorial Lecture" which should be delivered biennially or triennially on some subject of pharmacological or therapeutic interest It was further decided to recommend that the trusteeship of the fund be vested in the Royal Society of Medicine, and that the Council of the Section of Therapeutics and Pharmacology be requested to undertake the selection of the lecturer on each occasion

At the meeting of subscribers to the fund the recommendations of the Executive Committee were unanimously adopted It was decided that the Royal Society of Medicine be invited to undertake the trusteeship of the fund as recommended, and that Professor Langdon Brown, the treasurer, should hand over to the Society the proceeds of the memorial fund which amounted to approximately £700 The proceedings closed with a vote of thanks to the chairman and honorary secretaries, which was proposed by Sir Humphry Rolleston seconded by Professor Langdon Brown, and supported by Dr Alfred Cox and Dr C O Hawthorne

The annual report of the board of the Institute of Physics shows that the many activities of the institute have continued to prosper and that the *Journal of Scientific Instruments* has made satisfactory progress A new feature introduced during the year was the inclusion of articles specially written by authorities in their subjects, dealing with the trend of development of various classes of instruments and with matters of general interest to manufacturers The opening in May of the joint library and reading rooms by the president Lord Rutherford, marked an important step forward Its establishment is the result of the work of the Joint Library Committee originally set up by the Institute of Physics, the Physical Society of London and the Optical Society

England and Wales

Red Cross Rheumatic Clinic

At the last meeting of the council of the British Red Cross Society with H R H the Duke of York in the chair it was reported that at the society s clinic for rheumatism in Peto Place Regent s Park 78 589 attendances were made last year for treatment in the general patients department as against 77 892 in 1931 In the private patients department there were 8 040 attendances An investigation into the results of treatment of 2 133 patients discharged during the year with treatment completed showed that 73 4 per cent were cured or improved Out of a total of 3 154 discharged cases 36 per cent of the men and 43 per cent of the women were able to come for their treatment without interrupting their work and a further 22 per cent of the men and 6 per cent of the women were hoping to return to work at the end of treatment although they had been off work when they first attended The object of the clinic therefore—to provide facilities for treatment of those patients who are in the early stages of disease and who are still able to remain at work —is thus being clearly maintained The great anxiety of the early days of the clinic due to lack of available staff with experience in treatments by medical hydrology is now over Among the investigations now being carried out the following are mentioned in the medical board s report effect of autogenous antigen immunization in the treatment of rheumatism skin temperature and capillary microscopy in rheumatoid arthritis effect of specific and non specific vaccine therapy in rheumatism comparative radiological findings in non specific infective arthritis and rheumatoid arthritis classification and differentiation of the forms of arthritis occurring at the menopause and an estimation of the value of various forms of treatment in different types of rheumatism Regular courses of post graduate lectures and demonstrations have now been instituted under the auspices of the Fellowship of Medicine to which the clinic is affiliated and it is hoped gradually to extend their scope

Institute of Ray Therapy and Electro Therapy

The third annual report of the Institute of Ray Therapy and Electro-Therapy (Camden Road London) reviews the first three years of the existence of an institution which was primarily designed to help people of small financial means to have the benefit of various forms of electrical treatment From March 1930 to December 1932 4 601 patients were treated the total number of treatments being 194 514 and the number of medical practitioners in touch with the Institute being 1 131 In the twelve months ending December 31st 1932 1 616 new patients attended and over 80 000 treatments were given Of the 1 239 men and women discharged 69 2 per cent were well or improved 6 2 per cent were unimproved and the remainder were discharged because of unsatisfactory attendance or removal from the district Of the 294 children discharged 72 1 per cent were fit or improved and only 1 7 per cent showed no sign of benefit Treatments are arranged by appointment so there is no waiting—a highly appreciated convenience The conditions treated included convalescence after illness and operation general debility morbidity in workers due to deprivation of sunlight by reason of the conditions of their work bronchitis rheumatism and rheumatoid arthritis skin affections and diseases of children including rickets The patients are kept in touch with their own private practitioners during the light treatment being referred back to them should any fresh condition arise No patient has been admitted to the Institute without a commending letter from a medical practitioner The income limit is based on the scheme outlined by the British Medical Association and patients are expected to pay whatever they can afford towards the cost of their treatment the amount being left to the discretion of the patient s doctor A successful training course in ray therapy and electrotherapy was held in 1932 Sir William Hale White is president of the Medical Advisory Committee and its chairman is Sir William Hamer

Spa Treatment of Rheumatic Diseases

The annual report of the Royal Mineral Water Hospital Bath (National Hospital for Rheumatic Diseases) states that a very successful post graduate course arranged by the British Medical Association was held last October and some thirty doctors from various parts of the country attended On the financial and administrative side it was a difficult year with a deficit on the year s working of £1 733 The governors and committee feel that the future of the hospital depends in a great measure on decisions taken now Not only have the old fashioned arrangements structural and otherwise had to be overhauled at considerable expense in keeping with modern improvements but the advance in the treatment of rheumatism has called for outlay in all departments and outlay at the present rate cannot be continued unless means are devised for increasing income The medical report states that 1 145 patients were admitted during the year The diseases treated were chiefly rheumatoid arthritis including spondylitis osteo-arthritis (hips and spine showing the greatest incidence) subacute rheumatic infection gout fibrositis (including periarticular fibrositis, neuritis and sciatica The majority of these patients were benefited there were no deaths and the amount of general illness was very small In answer to a question often asked How far are the laboratories used for routine tests and how far for research purposes? the pathologist says it is impossible to draw any direct line of demarcation between these two uses For example over half of the 1 164 blood sedimentation readings have been for routine requisitions of the physicians the remainder were incidental to a research on the conditions affecting the sedimentation rate jointly undertaken with one of the physicians to which research belong also over 200 estimations of the various blood proteins The bearing of this investigation on the hospital work is direct viz the advisability or otherwise for our patients of a proposed treatment which has been the subject of much recent discussion

In Praise of English Cider

Cider is one of the oldest English beverages and its popularity is increasing Improvements in quality and methods of production that have been effected during the present century have done much to restore it to popular favour as a wholesome and refreshing drink especially during the summer months Even with these improvements there was no generally recognized standard of quality for English cider until 1931 when the national mark was applied to cider made from fruit grown in England and Wales Certain beverages to which the name of cider was attached were far from possessing the characteristic qualities of the vintage fruits with which it should be manufactured The success that had attended the application of the national mark to eggs canned fruits and vegetables and other home products led to requests from the cider industry itself that standards of quality should be set up also for genuine cider made with English fruit We are informed by the Ministry of Agriculture that there is now a national mark cider scheme in operation sixty four cider makers including most of the larger firms and three associations of farm cider makers have

The names of the Medical Selection Committee, upon whom candidates are requested to call together with other information should be obtained from the undersigned, to whom it is requested that applications, with copies of testimonials, be sent not later than Wednesday, April 12th.

J. P. WETENHALL, Secretary.

adopted the mark for all or part of their output In addition twenty-five firms of bottlers are authorized to bottle national mark cider obtained in bulk from the authorized makers The value of the mark to the distributor and consumer is that it is a national trade-mark, which carries with it a warranty not only of the home origin of the product, but also of its quality There are two grades—namely, ' select cider " and " select cider (champagne process) " For both grades the cider must be produced from apples and pears grown in England and Wales, and the finished product must be prepared from (*a*) pure fruit (apple and pear) juice, or (*b*) a pure fruit juice to which not more than 25 per cent of a syrup made from pure beet or cane sugar has been added The original gravity of the finished product must not be less than 1 04 at 60° F The cider must be made from clean and reasonably sound fruit, and be absolutely free from concentrated apple juice or other fruit juices, from artificial bouquets and essences, and from the recognized signs of inferior ciders such as ropiness sickness, and excess of acetic acid Samples of the product are taken for official analysis and the records of the authorized makers are examined In the national interest it is desirable to encourage the production of genuine English cider, both to provide a good and assured market for the home fruit grower, and to lessen imports of cider and of the raw material from which it is manufactured

Bristol Medical School Centenary

The final programme for the centenary celebrations of the Bristol Medical School is as follows Friday, June 30th 3 30 p m , receptions at the Bristol Royal Infirmary and the Bristol General Hospital by the Presidents , 7 30 p m , dinner at the University Union , 9 30 p m , reception at the University Saturday, July 1st 12 noon, congregation for the conferment of ordinary and honorary degrees in the Great Hall The Chancellor (the Right Hon Winston S Churchill) will confer honorary degrees upon the following the President of the Royal College of Physicians, the President of the Royal College of Surgeons the President of the General Medical Council, Sir Frank Colyer, Emeritus Professor Hey Groves, and Professor Miles H Phillips , 1 15 p m , luncheon at the University Union , 3 30 p m , garden party in the gardens of the Royal Fort, given by the Sheriff of Bristol (Dr W Kenneth Wills) Past and present members of the Medical School who intend to be present at the celebrations may bring a guest to each of the functions mentioned It is essential that applications for tickets should be made not later than to-day (June 17th)

The Harveian Society

The Buckston Browne annual banquet of the Harveian Society of London was held on June 8th at the Star and Garter Home for Disabled Sailors and Soldiers, Richmond After the loyal toasts had been honoured, The Harveian Society ' was proposed by Lord Lee of Fareham in a learned and witty speech The man whom they honoured, he said, had suffered the usual fate of pioneers in having his original communications received with a certain amount of distrust Harvey had no outstanding personal characteristics, and was, as Aubrey had said " a most likeable man ' After telling an anecdote in connexion with Harvey's visit to Germany after the Thirty Years' War, Lord Lee made some humorous references to the " early and disastrous history " of the medical profession The Prince of Orange, he said, had been trephined seventeen times whereas nowadays he would have taken aspirin In replying to the toast the president, Lieut -Colonel E L Gowland, commandant of the Star and Garter Home, expressed regret at the absence of Lord Riddell who had presented the society with a loving cup For the first time the Buckston Browne banquet was being held outside London He announced the gift from the society to Sir Buckston Browne of a garden-seat for the Buckston Browne Research Farm at Downe The health of the visitors was proposed in an amusing speech by Dr T C Hunt Confessing that he was more familiar with the Oval than with Southwark Cathedral, he said that he shared with the Bishop of Southwark common memories of the lectern at Magdalen College Chapel Replying for the guests the Bishop of Southwark remarked upon the magnificent site of the Star and Garter Home He referred to the bells of Hempstead Church, for which the Harveian Society had already raised £250 towards the £400 it had promised to subscribe Judge Cecil Whiteley, who also replied, said that this was the first time he had been entertained as a guest of the medical profession although he admitted that he had often been supplied with cocktails by his own doctor

London University Foundation Stone Ceremony

The following programme of events in celebration of the laying of the foundation stone of the new buildings for the University on the Bloomsbury site by His Majesty the King on Monday, June 26th, at 3 p m has now been provisionally arranged On June 24th, a dinner for about 400 persons at Grosvenor House Park Lane On June 25th, informal hospitality to representatives of British and foreign universities and learned societies On June 26th, informal dinners at certain colleges to the representatives of other universities and of learned societies , at 9 p m a reception given by the Chairman of the London County Council at the County Hall The accommodation on the site for the stone laying ceremony is necessarily limited, but provision is being made for about 3,000 people to be present The King and Queen will drive to the site, where they will be received by the Chancellor, the Earl of Athlone Before Their Majesties arrival there will be processions of teachers and others

Ireland

The Coombe Lying in Hospital

In 1932 the maternity department of the Coombe Lying in Hospital, Dublin, received 1,403 patients, of whom 1,288 were delivered there This represented an increase of 116 deliveries over the figure for the previous year In the extern department 1,480 cases were delivered, as compared with 1,500 in 1931 There were about 3,000 attendances at the ante natal department, one third of which were new cases There were eighteen deaths in the year, and the morbidity rate was 4 8 per cent (British Medical Association standard), the highest recorded during the tenure of office of the present master, Dr T M Healy It is stated in the annual report that examination of the mortality table shows that responsibility for at least three of the deaths does not rest with the hospital Thus one patient was admitted moribund from post-partum haemorrhage and another died an hour after admission in advanced eclamptic coma It is pointed out, however, that there were many cases of minor infection in the spring months, when overcrowding of the hospital is always greatest There were four deaths from sepsis—three in the spring, and one in the autumn Two deaths from detachment of the placenta in cases of marked hydramnios were particularly unfortunate Fewer cases of disproportion were treated operatively than in the preceding year There were ten cases of eclampsia with two deaths Labour was induced on thirty two occasions,

ROYAL ARMY MEDICAL CORPS.

TWENTY-FIVE *permanent* COMMISSIONS *in the* ROYAL ARMY MEDICAL CORPS will be offered on April 28th, 1933. Applications should reach the War Office not later than April 21st, 1933.

Candidates will be selected for commissions *without competitive* examination, and will be required to present themselves in London for interview and medical examination on April 28th, 1933. They must be under 28 years of age on May 1st, 1933, and registered under the Medical Acts.

Officers of the R.A.M.C. are liable to serve in any part of the world where British troops are quartered.

Ample opportunities exist in the Army for clinical professional work, both Medical and Surgical, as well as for the study and practice of Hygiene, Pathology, and all the special branches.

The cost of Post-Graduate study, which is compulsory, is met from Army Funds.

Emoluments: Pay—From £356 to £1,542 a year according to rank. **Allowances**—Free quarters, fuel and light, servant and rations, or cash allowance in lieu, totalling from 6/5d. to 23/3d. a day according to rank (£117 to £424 a year).

The above rates of allowances apply to Home Commands only. At certain stations abroad the rates are considerably higher.

Candidates who have held a full-time house appointment in a recognized civil hospital before appointment to a permanent Commission in the R.A.M.C. may, subject to certain conditions, be allowed to count the period of service in such an appointment, up to a maximum of 12 months, as Army service for promotion, increase of pay, and retirement.

Gratuities on Retirement.—After 7 years' service as a medical officer £1,000
„ 15 „ „ „ „ £2,800
„ 18 „ „ „ „ £3,500

Current rates of retired pay range from £352 10s. per annum, normally earned by a Major after 20 years' service, to £890 per annum, the maximum for which a Major-General is eligible. The rates of pay and retired pay are *subject to periodical variation consequent on fluctuations in the cost of living.*

Outfit Grant.—An officer on joining receives £50 as outfit allowance.

Married Officers' Allowances.—Officers of 30 years of age and over who are married are entitled to draw special rates of allowance.

A Voluntary Widows' and Orphans' Fund exists for officers of the Corps.

All particulars may be obtained by application, in writing or personally, to the Assistant Director-General, Army Medical Services, The War Office, Whitehall, London, S.W.1.

COUNTY BOROUGH OF BLACKBURN.

PUBLIC ASSISTANCE COMMITTEE.

RESIDENT JUNIOR ASSISTANT MEDICAL OFFICER.

Applications are invited from Medical Practitioners (male) for the appointment of a Resident Junior Assistant Medical Officer at Queen's Park Institution and Infirmary. The applicants must be registered as Medical Practitioners.

The staff consists of a Resident Medical Officer, a Resident Assistant Medical Officer, a Consulting Surgeon, a Laboratory Assistant and X-ray Attendant.

There is a separate Infirmary, separate Mental Block, and a separate Sanatorium for Children, and there is opportunity for experience in all departments, including medical, surgical, and midwifery cases. An X-ray apparatus is installed.

The person appointed will be required to devote his whole time to the duties, and also to act as may be directed by the Resident Medical Officer.

The appointment will be limited to a term not exceeding one year, with a minimum period of six months.

Salary £150 per annum (subject to a temporary economy deduction of £3 5s., together with board, apartments, and attendance.

Applications, stating age, qualifications, and experience, and accompanied by copies of not more than three recent testimonials, must be sent so as to reach the Public Assistance Officer, Public Assistance Offices, Cardwell Place, Blackburn, not later than April 5th.

Town Hall, BRIGGS H. MARSDEN,
Blackburn. Town Clerk.
March 25th, 1933.

ROYAL NORTHERN HOSPITAL, Holloway, N.7.

Applications are invited for the post of HOUSE PHYSICIAN, vacant on June 1st. The appointment is for nine months (three months as Out-patient Casualty Officer and Anaesthetist from June 1st, and six months as House Physician). Salary at the rate of £70 per annum, with board, residence, and laundry.

Applications, with copies of testimonials, should be sent by April 8th to the undersigned, from whom forms of application and rules can be obtained.

GILBERT G. PANTER, Secretary.

CITY OF BIRMINGHAM.

SELLY OAK HOSPITAL. (500 Beds.)

CASUALTY OFFICER (Male).

Applications are invited from fully qualified Medical Practitioners for whole-time appointment as "Casualty Officer" (male) at the Selly Oak Hospital, Birmingham. The appointment will be for a period of six months in the first instance, but may be extended at the end of that time for a further period of not exceeding six months.

Salary at the rate of £200 per annum and full residential emoluments. The salary and emoluments will be subject to any "voluntary abatement" in force from time to time. The officer appointed will be required to refund to the Council all fees, allowances, and emoluments (other than the foregoing) received by him.

Further particulars may be obtained from the Medical Superintendent at Selly Oak Hospital, to whom applications, stating age, experience, and qualifications, with copies of recent testimonials, should be forwarded not later than Wednesday, April 12th.

The Council House, F. H. C. WILTSHIRE,
Birmingham. Town Clerk.
March, 1933.

ROYAL SURREY COUNTY HOSPITAL, GUILDFORD. (182 Beds.)

Applications are invited for the post of SECRETARY-SUPERINTENDENT. Applicants should be under 45 years of age and should preferably have had previous experience of Hospital *management. Salary £500.* Full particulars, to be given in own handwriting, and copies of three testimonials, should be addressed to the Chairman at the Hospital on or before *April 15th. Canvassing prohibited.*

THE ROYAL INFIRMARY, SUNDERLAND. (290 Beds.)

TWO HOUSE SURGEONS and ONE HOUSE PHYSICIAN (male) required on May 1st. Salaries £140 per annum, with board, residence, and laundry. Applications, stating age, qualifications, and accompanied by copies of testimonials, to be sent to the undersigned immediately.

J. A. BEARDSALL,
House Governor & Secretary.

GLOUCESTERSHIRE JOINT COMMITTEE FOR TUBERCULOSIS.

STANDISH HOUSE SANATORIUM, STONEHOUSE, GLOS.

Applications are invited from registered Medical Men for the post of JUNIOR ASSISTANT MEDICAL OFFICER at the above Institution. No previous professional experience is necessary.

There are at present 250 beds, including men, *women, and children.* There is an orthopaedic block.

The salary is £250 per annum, with board, furnished apartments, and laundry, in addition, subject to an *economy* deduction of combined salary and value of emoluments as follows:

On the first £65 per annum, nil;
On the next £205 per annum, 2½ per cent.;
and 3½ per *cent. on* the remainder.

The appointment is for six months (with the possibility of extension for a further period of six months) and will be *terminable* within that period by one *month's notice* on either side.

Applications, stating qualifications and age, and accompanied by copies of three recent testimonials, should be received not later than *April 4th.*

Shire Hall, E. T. GARDOM,
Gloucester. Clerk of the Joint
March 23rd, 1933. Committee.

HULL ROYAL INFIRMARY. (367 Beds.)

Applications are *invited from* registered Medical Practitioners for the following posts (male):

ASSISTANT HOUSE PHYSICIAN. Vacant April 14th. Salary *at the rate of* £150 per annum, plus residence, board, and laundry.

CASUALTY OFFICER. Vacant April 17th. Salary at the rate of *£150* per annum, plus residence, board, and laundry. The officer appointed will work mainly under the direction of the Resident Surgical Officer.

The Successful candidates will be expected to stay for not less than six months, but the appointments are at any time determinable by one month's notice on either side.

Applications, giving particulars of age, experience and nationality, together with copies of testimonials, should be addressed to the undersigned.

R. J. CARLESS,
House Governor.
March 27th, 1933.

once by tube twenty seven times by drainage of the liquor amnii and four times medicinally Caesarean section was performed on twenty three patients—in eighteen for disproportion and in the remainder for multiple fibroids cervical fibroid heart disease persistent vomiting and a previous section respectively In the last case the patient had had Caesarean section performed in a preceding pregnancy for placenta praevia convalescence was complicated and it was decided therefore to avoid the risk of a second labour At the operation dense adhesions were found between the primary uterine scar and coils of the small intestine Details are given in the report of the various circumstances leading to the eighteen maternal deaths

Health Week in Belfast

Health Week in Belfast has been a great success Dr C S Thomson medical superintendent officer of health was responsible for the programme and many valuable suggestions were made for the co operation of local authorities in rural areas with the Belfast Corporation in the inspection of milk production In the course of his opening address Alderman J Dunlop Williamson M D chairman of the Public Health Committee said that Belfast was in a unique position It was a new city although it had old traditions and in the extremely rapid progress it had made in the last half-century or so it had suffered more or less by its growth which had been allowed to continue without supervision The result was that the death rate in the latter part of the last century had been far too high and typhoid fever had been endemic and epidemic in the city Something was clearly wrong and measures were required to preserve the health of the people As a consequence the early Sanitary Committee came into being to be followed by the Public Health Committee of the corporation in whose care the health of the city was placed That committee had worked with a will ever since its establishment and he was pleased to be able to say that typhoid was hardly known in Belfast to-day The position of Belfast among surrounding hills was unfortunate because the large chimneys of the various mills and factories spread a canopy of smoke over it through which the sun's rays did not percolate Belfast accordingly suffered from reduction of the health giving sunshine It was hoped however that as science progressed, as the smoke nuisance was abated and as sanitation advanced there would be no city in the kingdom as well and as healthy as Belfast The object of the Health Week was educative it aimed at indicating how every citizen could co-operate in achieving a happy state of health in the city

The Lord Mayor spoke appreciatively of the services of Dr Williamson as chairman and of those of the other members of the Public Health Committee who he said worked steadily and quietly week in and week out under the guidance of Dr Thomson for the benefit of the citizens There were few people who really gave any consideration to what the public health services in the city were doing and the best results could not be obtained unless the co-operation of everyone was secured and unless there was a realization that the public health authorities were working for the benefit of the whole community The Lord Mayor paid a tribute to the Water Board for its work in providing a pure water supply and offered friendly criticism to local authorities outside the city in regard to the inspection of the milk supply He thought there should be greater co-operation in this matter between the authority in Belfast and the local authorities outside the city The milk produced inside the city was examined at the source of supply by their own inspectors but they had no jurisdiction outside their own area He would agree with those outside authorities if all the milk produced in their areas were consumed there but some of it was sent into Belfast and he held therefore that the city authorities should at least have the power to inspect it at the source

Medical Officers' Salaries in Northern Ireland

A letter addressed to the Minister of Home Affairs by the Tuberculosis Committee of Belfast Corporation stated that although the duties and responsibilities devolving upon the three officers had in recent years very greatly increased the remuneration of the medical superintendent had at no time advanced there had been only minor increases in the remuneration of the other two officers concerned and emoluments that formerly attached to these positions had ceased These three officers were not it was added singled out especially for consideration increases were recommended for other officers in the department but the recommendations failed to receive the approval of the General Purposes Committee and were not included in those adopted by the Council The medical superintendent's present salary (£720 per annum) was some £160 below that at which he was appointed in 1924 by reason of (1) a loss of £80 per annum brought about by the passing of the Health Insurance Act of 1930 and (2) a loss of £80 per annum under the corporation's general salary cut It compared unfavourably with that of £950 per annum sanctioned by the Ministry of Health for England and Wales for similar appointments in Britain The Ministry of Labour now requested that the work of medical certification should be carried out as formerly but without fee or reward During the nine years since the medical superintendent's appointment his duties had increased greatly The sanatorium had been extended to 285 beds and the annual admission rate had risen from 467 in 1924 to 605 in 1932 To cope with the emergency a department for the treatment of children suffering from surgical tuberculosis was inaugurated in 1932 As a result the clinical work of the sanatorium had become exceedingly heavy Nevertheless the clinical staff had been reduced The services of a visiting physician had been terminated with a saving of £180 per annum and the services of the dispenser had also been discontinued effecting a further saving of £160 per annum Thus despite an increased number of patients and greatly increased clinical work there had been a reduction in expenditure of £340 per annum The abstract of accounts showed that in 1924 the expenditure was £26 974 while in 1932 it was £22 529 The cost per patient per week was the lowest of any institution in the United Kingdom treating a similar type of case The resident medical officer appointed in 1925 had received one increase of salary This increase of £50 had however been more than nullified by the loss of £80 per annum consequent upon the passing of the Health Insurance Act of 1930 He was in addition subject to the 10 per cent general salary cut the result being that he was to-day in receipt of £70 per annum less than when he was appointed his present salary being £360 The house physician appointed in 1929 on a temporary basis received one increase of £50 per annum in 1930 In her case the certification emoluments were approximately £50 so that no benefit resulted when the latter ceased She was also subject to the 10 per cent general salary abatement her present salary was £225 approximately £25 per annum less than upon appointment In reply to the Tuberculosis Committee the Ministry of Home Affairs stated that it was only a year since the corporation after careful consideration of the salaries in all departments decided that in view of the serious financial position it was necessary to reduce those salaries by 10 per cent and the Ministry

INDIAN MEDICAL SERVICE

Recruitment of European Officers.

Applications are invited from medical men for permanent commissions in H.M.'s Indian Medical Service. The terms offered include a gratuity of £1,000 on retirement after six years' service, or £2,500 after 12 years' service, together with free return passages for those who no longer desire to remain in the Service. *In other respects the terms will be as detailed below.*

Candidates must be European British subjects under 32 years of age at the time of application, and must be registered under the Medical Acts in force in Great Britain and Northern Ireland.

CAREERS.

The Indian Medical Service offers wide opportunities of medical experience, including clinical, preventive, specialist, and research work. At the beginning of his career an officer is employed on the military side, which has medical charge of the Indian Army. Promotion is on a time scale up to the rank of Lieutenant-Colonel, and by selection to the ranks of Colonel and Major-General. An officer may apply after one year's Indian Service to have his name registered for transfer to the civil side, from which appointments are made to Civil Surgeoncies, which are established at the principal civil centres to provide for the medical needs of civil officials and for general medical administrative purposes; to specialist (for example, public health and bacteriological) services; to research posts; and to professorships at the Medical Schools.

NOTE.—It is not possible to state at present what, if any, prospects of employment on the civil side will be open to Indian Medical Service Officers under the proposed new constitution for India.

PAY.

Owing to the state of the financial emergency at present prevailing in India it is proposed to subject the existing monthly rates of pay, which are as follows, to a temporary reduction not exceeding 5 per cent.

Rank.	Service in Rank.	Basic Pay.	Overseas Pay.	Year of Total Service.
		Rs.	Rs.	
			150	1st
Lieut.	—	500	150	2nd
			150	3rd
			150	4th
Capt.	(i) During first 3 years' service as Captain	650	£15	5th
			£15	6th
			£25	7th
	(ii) With more than 3 and less than 6 yrs.' service as Captain	750	£25	8th
			£25	9th
			£25	10th
	(iii) With more than 6 years' service as Captain	850	£25	11th
			£30	12th
Major	(i) During first 3 years' service as Major	950		
	(ii) With more than 3 and less than 6 years' service as Major	1100		
	(iii) With more than 6 years' service as Major	1250		
Lieut.-Col.	(i) Until completion of 23 years' total service	1500	£30	13th and over
	(ii) During 24th and 25th years' service	1600		
	(iii) After completion of 25 years' total service	1700		
	(iv) When selected for increased pay	1850		

EXTRAS.—In addition to the above rates various allowances are admissible for a large number of special appointments on both the military and the civil side which may be held by members of the Indian Medical Service. Special high rates of pay are also attached to the numerous administrative appointments open to officers in both branches of the Service.

ANTEDATES IN COMMISSION.

Any service rendered by an officer during the war as a medical or combatant officer, or in a position usually filled by an officer, may be counted as service for increments of pay, promotion, retirement and retired pay, but not for gratuity.

One half of any service in the ranks during the war may be counted as service for retirement and retired pay only.

Candidates possessing certain higher medical qualifications may be granted an antedate of one year in their commissions. Past service in certain hospital appointments may also render candidates eligible for an antedate of one year. Persons holding or about to hold resident posts at recognized hospitals may be seconded in those posts for a period not exceeding one year. The maximum period of antedate, secondment, or antedate and secondment combined, admissible under this paragraph, is limited to one year.

OUTFIT ALLOWANCE.

Officers on appointment will receive an allowance of £50 towards the cost of outfit.

PRIVATE PRACTICE.

With the exception of Administrative Officers, military or civil, and officers holding certain special appointments, officers are not debarred from taking private practice, so long as it does not interfere with their proper duties.

LEAVE.

Leave can be taken at reasonable intervals, and adequate rates of leave pay are provided. Extra leave (known as study leave), which may not exceed 12 months in all during an officer's service, may be granted to officers desirous of pursuing special courses of study of a post-graduate nature. During such leave, study allowance, at present fixed at the rate of 12s. a day in the United Kingdom, £1 a day on the Continent of Europe, and £1 10s. a day in the United States of America, is granted to an officer in addition to ordinary rates of leave pay.

PENSIONS.

The rates of pension are as follows:

	Per annum £
After 17 years' service for pension	400
,, 18 ,, ,, ,, ...	430
,, 19 ,, ,, ,, ...	460
,, 20 ,, ,, ,, ...	500
,, 21 ,, ,, ,, ...	540
,, 22 ,, ,, ,, ...	580
,, 23 ,, ,, ,, ...	620
,, 24 ,, ,, ,, ...	660
,, 25 ,, ,, ,, ...	700
,, 26 ,, ,, ,, ...	750
,, 27 ,, ,, ,, ...	800

These rates are subject to alteration on account of a rise or fall in the cost of living as compared with the year 1919 to an extent not exceeding 20 per cent. in all. At present a reduction of 8½ per cent. is being made on this account.

There are additional pensions ranging from £65 to £350 per annum for officers who have held administrative appointments.

PASSAGES.

An officer on appointment is provided with free passage to India. The wives and families of officers who are married prior to the date of the officers' embarkation on first appointment will also be provided with free passage to India, subject to the payment of messing charges.

Officers and their families are also eligible for passage concessions under which they are granted a certain number of return passages home at Government expense during their service.

INSTRUCTION PRIOR TO EMBARKATION.

Officers are required to undergo courses of instruction at the Royal Army Medical College and at Aldershot, lasting approximately six months, prior to their embarkation for India on first appointment. Information as to the rates of pay admissible during this period and subsequently up to arrival in India is contained in the memorandum referred to below.

A memorandum giving full details regarding these appointments and forms of application may be obtained from the Under-Secretary of State for India, Military Department, India Office, London, S.W.1. The Selection Committee will meet at the India Office early in April next, and the selected candidates will be required to join a course of instruction commencing towards the end of April prior to sailing for India about November, 1933. Applications should be submitted as soon as possible.

was not aware that circumstances had changed so as to justify after such a short interval, increases to certain officers which would not only nullify the reduction but would leave these officers in a better position than before The Ministry regarded the proposal as premature at the present time, but if the corporation wished to submit proposals after the end of the current financial year, the Ministry would be prepared to consider them in the light of the circumstances then existing

Scotland

Welfare of the Blind

At the sixteenth annual conference of the Scottish National Federation for the Welfare of the Blind, held on June 8th and 9th at Kirkcaldy and Dunfermline Dr F M Earle, rector of Kirkcaldy High School contributed an address on the psychology of the blind There was he said a conspicuous lack of established facts regarding the various effects of total and partial blindness upon the learning capacities of different individuals, and there was great scope for psychological research into these problems Partially blind and totally blind children were at present taught in the same classes and by the same methods, and he doubted whether this was a sound procedure Dealing with the question of providing employment for blind workers, Dr Earle said that five years ago, when the National Institute for the Blind made an inquiry into this question all sorts of difficulties were raised by employers, but it had been found that most of these could be removed to some extent by appropriate organization, as, for example, the inclusion of one or more blind workers in a factory "team" It might be possible in the future successfully to provide work for the blind, even though this might have to be of the simplest repetitive kind

A discussion on modern tendencies in blind welfare administration was opened by Mr John R Mackenzie, general superintendent of the Northern Counties Institute for the Blind Inverness, who said he believed that the increased responsibility towards the blind imposed upon local authorities by Act of Parliament might, within the next ten years, entirely alter the character of blind welfare work Managers, staff, and directors of agencies for the blind must place their knowledge at the disposal of the local authorities so that the latter might entrust to them the administration of the schemes which were springing up for the welfare of the blind Dr Robert A Krause deputy medical officer of health for Fife, said that there were both advantages and disadvantages in institutional education for the blind, for such a training made it difficult for a blind child to take his place again naturally in the social system, and teachers also tended to become institutionalized so that they did not sufficiently recognize the social problems outside There was a large proportion of mentally defective children among the blind, recent returns from the Department of Health had shown that over 12 per cent of blind children between the ages of 5 and 15 were mentally defective It was necessary to alter the present purely vocational kind of education

At a public meeting in Kirkcaldy Dr John Marshall, speaking of his experience as a certifying surgeon in the Glasgow Blind Clinic said that, in regard to the standard of blindness, there had been in certain conditions a relaxation in favour of the applicant The great benefit derived from the standards that had been set up was that ophthalmic surgeons in all parts of the country could apply the definition of the Act more uniformly Until the system of certifying all blind persons by regional clinics had been in operation for some years there must be cases involving a certain degree of hardship where persons previously certified as blind had to be de certified

Smoke Abatement

At the annual meeting of the Scottish Branch of the National Smoke Abatement Society, held in Edinburgh, Lord Provost W J Thomson, in welcoming the delegates, said that the society had been engaged on a most important problem for twenty-four years—namely, the abolition of the smoke pollution of the atmosphere It was beyond dispute that if the smoke pall which hung over large towns could be removed, the daily labours of housewives would be reduced by a half A large proportion of deaths from pulmonary disease was due to the inhalation of smoke-laden, poisonous atmosphere It was surely just as essential to secure pure air as to obtain supplies of pure water, milk and food In Edinburgh it had been estimated that the introduction of heating and cooking by gas had supplanted the direct burning of approximately 80,000 tons of coal, and there was now less pollution of the atmosphere by smoke than in most other cities of a similar size The annual report of the society had stated that household chimneys were now responsible for the greater part of air pollution The preference for a raw coal fire was merely sentimental, and an equal, if not a greater, amount of heat could be obtained by smokeless methods Professor William Oliver, Edinburgh University, said that complete smoke abatement was very far from attainment and the problem of domestic smoke diminution depended primarily upon the use of smokeless fuel such as coke together with an increasing use of gas and electricity The ideal system would be one in which all raw coal was treated by low-temperature carbonization, and the gas thus obtained used for boiler firing, while the oil, tar and other by-products were employed to reduce imports of these commodities, and the coke used for domestic purposes

Foot Clinics in Scotland

At the annual meeting of the Edinburgh Foot Clinic, with Professor John Fraser in the chair Mr Walter Mercer said that the number of treatments carried out at the clinic had risen during the past year from 8,297 to 10,362, an increase of 25 per cent It was a matter for gratification that the public was being educated to the preventive aspect of chiropody This was the only school of chiropody in Scotland which was recognized by the medical profession At the close of the meeting the clinic was visited by the Lord High Commissioner to the General Assembly of the Church of Scotland

At the second annual meeting of the Glasgow and West of Scotland Foot Hospital, which was held on the same day, with Lord Provost A B Swan presiding, it was reported that the number of patients treated during the year ended March 31st last was 1,310, and that 5,230 individual treatments had been given Donations from patients had amounted to £132, and the institution had ended the year with a surplus

Health of Dunfermline

The annual report of Dr C Barclay Reekie, medical officer of health for Dunfermline, shows that the estimated population of this burgh to the middle of 1932 was 35,694, and that the number of births registered during the year was 655, giving a rate of 15.4 per 1,000 as compared with the average for the last five years of 16.26 The number of deaths of children under 1 year was

THE ROYAL HOSPITAL, WOLVERHAMPTON.
(Incorporated under Charter.)

HOUSE SURGEON required. Duties include Orthopaedic Surgery as well as General Surgery.

twenty seven giving an infantile mortality rate of 49 which is a marked reduction on the average of 62 for the last five years and is the lowest infantile mortality rate on record in the burgh The number of deaths registered was 472 and after correction for transfers the rate was 11 9 per 1 000 as compared with the average of 12 58 for the past five years Heart disease was responsible for the greatest number of deaths malignant disease came second The number of cases of scarlet fever notified was 251 diphtheria fifty eight acute pneumonia thirty six puerperal septicaemia three measles 703 whooping-cough fifty five and cerebro-spinal fever nine Insulin was supplied to nine patients during the year five persons in necessitous circumstances received it free two with assistance and two on repayment altogether 382 ampoules each of 100 units were issued from the Public Health Department The report also stated that the town council had become partners with other local authorities in a joint scheme for the West of Fife for the treatment of infectious diseases and the West of Fife Infectious Diseases Hospital had been considerably extended during the year Public assistance patients had been treated by two part time medical practitioners and their prescriptions dealt with as under the national health insurance scheme

France

[FROM OUR CORRESPONDENT IN PARIS]

Professor d Arsonval s Jubilee

On May 27th the jubilee of Professor d Arsonval was celebrated at the Sorbonne in the presence of the President of the Republic Since 1872 this savant who carries his eighty two years with youthful nonchalance has taught at the Collège de France The public and to a certain degree even the medical profession has been ignorant of d Arsonval s contributions to the sciences of physics and medicine To many he has just been a name to still more his name even has been unknown until this present jubilee was made the occasion for short explanatory articles in the medical and lay press Working on the physiology of the muscles and nerves he found he had to create new electrical equipment and as his researches proceeded he conjured up one delicate instrument of precision after another—electrodes galvanometers the electric bistoury etc The father of diathermy he has opened out new fields the therapeutic possibilities of which have not yet been fully explored In response to the many laudatory addresses delivered in the great amphitheatre of the Sorbonne d Arsonval in a simple speech gave the credit for the influences which had inspired him in his youth to one man and one setting The man was Claude Bernard and the setting was the Collège de France Here sixty years ago Claude Bernard made it possible for his youthful pupil to develop those qualities which have yielded such wonderful fruit After Claude Bernard d Arsonval mentioned the names of two men—Marey and Brown Séquard —to whose inspiration he owed much

Problem of the Medical Student

Medical education is still in the melting pot and it is only the clairvoyant who can say what the ultimate stew will be like The passage of the Armbruster Bill through the Legislative Assemblies has been facilitated by the present and impending invasions of the medical profession by foreigners most of whom come from Eastern Europe Whether it be true or not that they are almost as numerous as the French students there is no escaping the fact that the medical profession in France is yearly becoming more overcrowded In the cities in particular it is already difficult for the rank and file to make a respectable living It is therefore quite natural that the provisions of the Armbruster Bill for the exclusion of the foreigner should be generally welcomed Another question over which there is much less sweet reasonableness is that of the medical student s preliminary studies The academically minded would like him to serve an apprenticeship in Greek and Latin The socialistically minded see in these dead languages an artificial barrier protecting the select from the crowd As for the student who has satisfied his examiners in the preliminary subjects how is he to pursue his medical studies so that he emerges from the ordeal as a competent medical practitioner? During a recent discussion at the French Academy of Medicine Professor Georges Haye m indulged in some plain speaking The Ministry of Public Health he pointed out had decided to build a brand new Faculty of Medicine at the cost of some 800 million francs just at a time when serious economies were necessary This he thought was putting the cart before the horse and he suggested that spacious quarters might be wasted if their prospective occupants had no adequate provision for their systematic education In the past the authorities concerned had muddled along attempting to improve the teaching by multiplying the number of chairs in certain disciplines Professor Hayem s calculations as to the number of medical students at the Faculty of Medicine in Paris alone are impressive For the year 1932-3 there were 3 500 matriculations If the duration of the medical curriculum be put at five years there should be over 17 000 medical students in Paris at the same time if there be no fallings off Professor Hayem allows for them liberally and thus reduces his total of medical students to about 10 000 But even so!

Annual Congress of Forensic Medicine

The French Annual Congress of Forensic Medicine was held at the end of May at the Medico-Legal Institute in Paris under the chairmanship of Professor Balthazard One of the most interesting communications was made by Dr Chavigny of Strasbourg who chose as his subject forensic medicine and bacteriology As he pointed out microbic epidemics may have a criminal origin or at least a criminal element Among the incidents with which he chose to illustrate his paper was of course the Lübeck trial It was conspicuous among other things for the human passions it provoked It will be remembered that this trial hinged on the question whether the babies who had died after inoculation had been given pure B C G cultures or virulent tubercle bacilli—a question which could only be satisfactorily approached and answered in a spirit and atmosphere of detached scientific inquiry Instead the trial became a public sensation and the medical profession was butchered to provide a Roman holiday Another case recalled by Dr Chavigny was that of the epidemic of typhoid fever some years ago at Lyons where the geographical distribution of the disease led to the incrimination of a limited section of the town and to a water supply the contamination of which was alleged to be due to criminal negligence After discussing suicides and attempted murders by the inoculation of cultures of virulent germs Dr Chavigny held up the spectre of bacteriological warfare and reminded his audience that the special committee of the Disarmament Conference had concluded that it would be impossible to prevent such warfare His macabre paper is to be recommended as useful raw material to the would be authors of shockers

APPOINTMENTS.—Important Notice.

Medical practitioners are requested not to apply for any appointment referred to in the following table without having first communicated with the Medical Secretary of the British Medical Association, B.M.A. House, Tavistock Square, W.C.1 (in the case of Scottish appointments, with the Scottish Medical Secretary, 7, Drumsheugh Gardens, Edinburgh).

Applications, stating age, qualifications, experience, and nationality, accompanied by copies of three recent testimonials to be sent to the Medical Superintendent.

(Appointments continued on p. 52)

CORRESPONDENCE

"Back Pressure" and "Compensation"

SIR,—Sir Thomas Lewis's little book, *Diseases of the Heart* has come as a welcome aid to the practitioner, who, while attempting to keep up with the latest findings in connexion with circulatory conditions, is apt to feel swamped by the mass of "new" details that are constantly appearing in print. The book contains the essentials in a delightfully clear and readable form. But while yielding to none in my admiration of the author's work, it seems to me that he goes a little too far in condemning the two time-honoured views as expressed by the terms "back pressure" and "compensation."

To take the latter first, compensation surely well expresses the idea of making up for some deficiency. The word means "the act of giving an equivalent for" and "the act of counterbalancing or recompensating or making amends", and we see the process occurring in every direction, when something lessens the efficiency of an organ or it is called upon to do more work than is its wont. One lung is collapsed and the loss is compensated for by the more efficient action of the other. One kidney is removed and the other works for both. A blacksmith labours harder than the average man and his muscles enlarge in order that he may carry on. An individual goes to a place at several thousand feet elevation and his body compensates for the lowered oxygen pressure by an increase in the number of the red cells and the total haemoglobin, along with deeper and more frequent respirations. A man suffers from some organic lesion of the brain which causes anaemia of a vital centre and the blood pressure rises, sometimes enormously, in an endeavour to get blood into it and so saving life.

In the same way, some lesion of the heart makes that organ a less efficient pump than normal and the myocardium accommodates itself to the increased load by hypertrophying and by more efficient contractions, and thus the sufferer is said to have a compensated lesion. In time, owing to any cause increasing the obstruction or lessening the efficiency of the muscle, he begins to suffer from dyspnoea and other signs of cardiac distress, and it is commonly said, and I think with clarity, that the compensation is lessening. When one watches a patient with, say, mitral stenosis, who for years has been able to live a normal life, and sees, or even hears, that his breath is not so good as formerly and that he cannot do the things that he had been accustomed to do, surely it is correct (without going into details of whether or not dilatation is occurring) to feel assured that his compensation (in other words his cardiac reserve) is diminishing, and that myocardial failure is appearing. It is our duty then to endeavour to discover the cause of this lessening myocardial efficiency, which may be due to some pathological change in the muscle tissue and often to some disturbance in rhythm such as auricular fibrillation. Frequently we are able, by lessening the work of the heart or by improving the action of the muscle, once again to enable the organ to do its work sufficiently, and surely it is correct to say that compensation has been restored.

Back-pressure theory. Sir Thomas is strong in his condemnation of this term, and yet it undoubtedly expresses what may be happening in the circulation when some obstruction or regurgitation is sufficiently severe to hamper the free onflow of the blood and thus tend to raise the pressure behind the lesion. I say "sufficiently severe" because, as is now well recognized, a considerable obstruction or regurgitation often exists without doing any harm. But when in, say, mitral stenosis real obstruction exists and the blood pressure in the left ventricle rises, then there is a tendency to damming back of the pulmonary circulation, and the right ventricle works against extra resistance. It may for long succeed, so that the circulation is successfully carried on and there is no interference with the cardiac output, but in time the systemic venous return is hampered, and so the whole train of signs and symptoms associated with congestive circulatory failure develops. It seems to me that here the idea of back pressure clearly expresses the condition. I think that Sir James Mackenzie was the first to condemn the back pressure theory. He did this in emphasizing the fact, until then not sufficiently recognized, that it was not the valvular defect but rather the myocardial failure that was all important, but all the same it was the valvular trouble that primarily threw the extra work on the right ventricle. If only we could, at an early stage before myocardial changes had occurred, lessen the obstruction—as has even been attempted by keen surgeons—the muscle, thus having less work to do, might for long be able to carry on. For these reasons, which seem to me, at least, to have some weight, I would regret to see the terms "compensation" and "back pressure" relegated to a back shelf.—I am, etc.,

Toronto, May 25th. R. D. RUDOLF.

Specific Treatment of Pneumonia

SIR,—In a leading article in the *Journal* of June 3rd (p. 967) you referred to the enthusiasm displayed in Germany for the treatment of acute lobar pneumonia with optochin (ethyl hydrocuprein), stating that marked reductions in mortality were claimed. You suggested that such claims should surely not be ignored, and you asked whether an extended trial of this drug and of solvochin could not be undertaken.

I have had no experience with solvochin, but an extensive study of optochin was made by me while I was on the staff of the Hospital of the Rockefeller Institute for Medical Research, New York, during the years 1915 to 1918, these studies resulted in three papers on the pneumococcicidal action of optochin *in vitro* and *in vivo*, which appeared in the *Journal of Experimental Medicine* in 1915, and in two papers, published in collaboration with Dr. Alan M. Chesney, on the use of the drug in the treatment of pneumococcal pneumonia in man, which appeared in the *Archives of Internal Medicine* in 1917 and 1918. Although we were able to devise a method of oral administration which readily produced and maintained in the blood of pneumonia patients a strong pneumococcicidal action, we were unable to conclude that the drug was efficient in the treatment of the disease. We stated that the systematic use of optochin in the treatment of seventy-five closely studied cases of lobar pneumonia did not lead to any noteworthy therapeutic benefit and that the rate of pneumococcicidal action in the blood was too slow to be effective in the concentrations of the drug which could be safely attained in the blood stream. Toxic effects were seen in twenty-four of the cases treated, but, fortunately, all were slight and temporary. In the concentrations which might safely be attained in the body fluids the drug probably penetrates but poorly into the alveolar exudate, unless used very early in the disease. Moreover, a progressively increasing bacteriaemia was observed several times in animals and in man, in spite of a considerable degree of pneumococcicidal action in the blood.

As the serum treatment of lobar pneumonia was so successful in Type I we treated only a few cases of that type with optochin. As is suggested in the leader,

the use of optochin may be more successful in Type I but its possible toxic effects especially those in relation to vision should be remembered —I am etc

Professor of Medicine University College Dublin

Genesis of Gall stones

SIR —I join Mr J A Gardner and Dr H Gainsborough in absolving Mr Patey for not mentioning my work in his paper on The Mechanism of Gall stone Formation in the *Journal* of May 20th (p 866) as it had not been published Lord Moynihan however was perfectly justified in commenting on Mr Patey's failure to refer to Lord Moynihan's article on Some Aspects of Cholelithiasis in which incidentally my findings are quoted

Mr Patey aptly remarks at the conclusion of his paper because of the predominant position that surgery occupies to-day in the treatment of gall stones the surgeon may yet do much to initiate work which will lead to an increased knowledge of gall stone formation Surely then it is an omission on his part to ignore the views of Lord Moynihan whose experience of gall bladder surgery is unrivalled even though these do not coincide with the views of Mr Gardner and Dr Gainsborough The latter suggest that Lord Moynihan was not in a position to define the term hypercholesterolaemia because he had no knowledge of normal limits In MacAdam and Shiskin's work which Lord Moynihan quotes the upper and lower limits for plasma cholesterol—based on analysis of the blood of twelve normal individuals—are given as 0 191 per cent and 0 133 per cent with an average of 0 162 per cent Mr Gardner and Dr Gainsborough refer very loosely to these limits as arbitrarily chosen because the figures for the normal individuals were not given in detail in that paper As these figures had already been given in my thesis for M D Glasgow (1922) there seemed no need to present them again However to satisfy Mr Gardner and Dr Gainsborough that they were not arbitrarily chosen limits I give them in detail now

Cholesterol Content of Blood Plasma of Twelve Normal Individuals

Age	Sex	Total Cholesterol in Grams per 100 c.cm.
28	♂	0 191
22	♂	0 155
58	♂	0 164
40	♂	0 160
18	♂	0 156
43	♂	0 191
47	♂	0 164
?	♂	0 133
?	♂	0 150
53	♂	0 180
20	♀	0 148
46	♀	0 153

These figures are in close agreement with those of other workers McNee[1] (0 150–0 180 per cent) Autenrieth and Funk (0 140–0 160 per cent) Weston[2] (0 180 per cent) Myers[3] (0 168–0 175 per cent) and Müller[5] (0 140–0 160 per cent) My average of 0 162 per cent is even in agreement with that of Mr Gardner and Dr Gainsborough (0 170 per cent for males and 0 153 per cent for females) although their[4] variations are much wider (0 080–0 230 per cent) They object to Lord Moynihan's use of the term high normal as applied to figures between 0 160 and 0 192 per cent Is not one perfectly justified in speaking of figures above the average as on the high side although still within normal limits ?

Mr Gardner and Dr Gainsborough state that hypercholesterolaemia is not known in cases of gastric ulcer I invite them to give their figures in this condition In twenty six cases of gastric ulcer examined by me 23 per cent were hypercholesterolaemic as also were 12.2 per cent of forty-one cases of duodenal ulcer These cases formed part of a series of 280 cases with various surgical abdominal disorders examined for the purpose of ascertaining whether hypercholesterolaemia occurred with greater frequency in cholelithiasis as compared with other conditions In 101 cases of cholelithiasis in this series the average cholesterol value was 0 217 per cent 65 per cent of these patients showed an absolute hypercholesterolaemia The diagnostic significance of an increased cholesterol content of the blood is therefore important as in this series of 280 cases over 75 per cent of patients with hypercholesterolaemia were suffering from cholelithiasis as proved by operation

Mr Gardner and Dr Gainsborough observe that it is practically impossible to state that a moderate degree of hypercholesterolaemia is present in an individual case from single observations unless the individual's normal plasma cholesterol content has been previously well studied Is this not rather a facetious remark? Surely these patients first present themselves for observation when they are already pathological How could their previous normal plasma cholesterol content have been well studied ?

Mr Gardner and Dr Gainsborough state that hypercholesterolaemia occurs whenever biliary obstruction is present but not in uncomplicated cases of cholelithiasis I dispute the accuracy of that statement I did find hypercholesterolaemia even in some uncomplicated cases of cholelithiasis What is more on scrutinizing Mr Gardner and Dr Gainsborough's figures as set out in detail by them[7] I find that four of their cases of cholelithiasis without jaundice or other complications were definitely hypercholesterolaemic applying the term as they themselves understand it to figures above 0 23 per cent I refer to their cases 7 8 15 (second observation) and 17 for which the figures are 0 2548 0 2769 0 2563 and 0 2561 They ask But why does Lord Moynihan ignore the more complicated changes which occur in the blood in these cases of biliary stasis such as have been demonstrated not only by ourselves but also by Thannhäuser and Schaber Adler and Lemmel etc Lord Moynihan ignores these changes for a very good reason His paper was published in 1925 An account of these more complicated changes —a disturbance of the cholesterol to cholesterol-ester ratio—was not given by Thannhäuser and Schaber till 1926 Adler and Lemmel published their results in 1927 and Mr Gardner and Dr Gainsborough's paper on the subject appeared in 1930 How could Lord Moynihan in 1925 refer to work which Mr Gardner and Dr Gainsborough did not publish until 1930? Their statement that in Lord Moynihan's paper the graphs of changes in pregnancy and during menstruation were drawn with exaggerated ordinates is entirely unwarranted They were drawn with mathematical accuracy and were based on the figures obtained by me in the case of twelve pregnant women and in the investigation of six menstrual cycles On the whole Mr Gardner and Dr Gainsborough's criticism in this connexion cannot be regarded as other than frivolous especially as they themselves state that some cases of pregnancy show a definite total hypercholesterolaemia a result which is in general agreement with those of earlier observers Moreover Gonalous[8] and Okey and Bowden[9] have described changes in the menstrual cycle similar to those represented in the graph under discussion

In conclusion I do not agree with the statement made by Mr Patey and supported by Mr Gardner and Dr Gainsborough that attempts to correlate hypercholesterolaemia with gall stones have failed I intend shortly

YOUNG LADY SEEKS POST AS SECRETARY-RECEPTIONIST; 9 years' hospital experience. Thoroughly efficient and highly recommended. — "R.," 52, Geary Road, N.W.10. (Gladstone 4543.)

SIR,—In a letter to the *Journal* of June 10th (p 1025) Dr Spicer states that it would be interesting to know on what grounds the pancreas is considered to be involved in mumps

During the last five years I have met with three cases of extremely severe diabetes mellitus in children in which the onset was immediately preceded by an attack of mumps In the first, a boy of 13, a moderately severe attack of mumps left him out of sorts for three weeks Severe thirst and polyuria then developed, and three days later he sank into a diabetic coma with a blood sugar of 0 6 per cent He never complained of any abdominal symptoms In the second, a boy of 12, the attack was followed by epigastric discomfort for a fortnight, and he then developed thirst and polyuria, and lost weight rapidly Three months later he had a resting blood sugar of 0 28 per cent , and passed 113 grams of glucose in a day In the third, a boy of 7, "influenza" was followed by mumps The attack was a mild one, but was accompanied by some abdominal pain, which lasted for eight days Three weeks after this he developed sudden polyuria and thirst, and began to waste His urine was then found to contain a great deal of sugar and acetone bodies, and he subsequently developed diabetes of the greatest severity

It is impossible to say whether the diabetes in these cases was the result of pancreatic damage due to mumps or whether the latter was merely the infective factor which brought to light a latent diabetes They do, however, suggest that the pancreas may be affected, even though the abdominal symptoms are slight or absent In none of these cases could any family history of diabetes be traced —I am, etc ,

Cambridge June 9th LESLIE COLE

"Observation Hips" and the Mantoux Test

SIR —In your issue of June 3rd (p 951) Mr R W Butler gives an interesting account of a "follow-up" of twenty-two "observation hips" The term (like our war weary P U O and N Y D) is unknown to the compilers of *The Nomenclature of Diseases* but it serves a useful though unofficial function until a more accurate label can be chosen

I have notes of similar cases of my own, and the following are good examples, with a moral at the end of the story

CASE I

Thomas P aged 10 years 9 months was seen at the Hospital for Sick Children Great Ormond Street on March 26th 1928 with pain in the left hip following a slight injury He then had limitation of all movements of the joint His tonsils and adenoids were removed and he was transferred to the country branch at Tadworth where he was treated in a double Thomas hip-splint for two and a half months As he then had no muscular wasting and movements were free and x ray examination was negative he was allowed gradually to resume a normal life and returned home in July 1928 after three months observation Three years later I sent for him and found him completely normal both clinically and radiologically He had no pain and 'played inside left with great success

CASE II

Richard P aged 8½ years, was seen on June 20th 1927 with a history of five weeks' aching in the right hip but no limp There was slight general restriction of movement in all directions and a family history of tuberculosis *X*-ray examination was negative He was also placed in a double Thomas hip splint and transferred to Great Ormond Street Country Branch where he spent a mere six weeks and returned home walking on September 14th 1927 I saw him in October 1931 which was four years after this episode he was normal in every way and a radiogram showed no sign of past or present disease

These children had a transient arthritis, which I do not believe was tuberculous, and yet one was put to the necessity of treating it as such until the clinical course proved otherwise Nowadays I place great reliance on the Mantoux test, and it has many times helped to a correct and early diagnosis in such cases Mr Butler makes no mention of this useful procedure, which still suffers from confusion with less reliable subcutaneous methods and that of von Pirquet The Mantoux test must be carried out in a standardized manner, and the following details are important

Human tuberculin 1 in 1 000 in 0 5 per cent carbolic saline will keep safely for about four weeks in an ice-chest A special intradermal syringe is necessary, and 0 1 to 0 2 c cm are injected into the skin of the forearm No control is necessary and the reaction develops as a marked red ring one inch or more in diameter during the next three days A little experience is necessary in reading the results, but it is soon acquired

My present view is that a negative Mantoux test precludes tuberculosis in these "doubtful hips" and though a positive result is less helpful, it must be remembered that practically 80 per cent of London children under 12 years of age have a negative Mantoux (Gaisford) I believe that this test might be more widely used by doctors in general and by orthopaedic surgeons in particular, for though there are many causes of transitory arthritis of the hip joint there is only one that really matters —I am, etc ,

London W 1 June 6th ERIC I LLOYD

Hernia and Appendicectomy

SIR —I have deliberately refrained from joining in this correspondence till now because I believe that no amount of argument will influence any experienced surgeon to relinquish a technique which in his hands yields satisfactory results Nevertheless I do resent unjust criticism of the gridiron incision on purely theoretical grounds It is common experience in the average hospital to find equally staunch adherents of Battle's incision and McBurney's operation, and most surgeons soon decide which *in their hands* is the better method Surely this is the crux of the matter

An incision placed as near the anterior superior spine of the ilium as possible offers the following practical advantages possessed by no other

1 There is little or no small bowel protrusion even with an indifferent anaesthetic peritoneal closure is simple

2 There is less risk of soiling the peritoneal cavity when dealing with a localized abscess it is nearly always possible to search for and remove the appendix in these cases without any undue risk to the patient

3 In a simple case the peritoneum can be dealt with in the same way as a small hernial sac, leaving no raw edge for subsequent adhesions

4 If drainage is necessary the subsequent adhesions will be between the caecum and peritoneum , this is far better than adhesions between peritoneum and small bowel

I believe that these four points are definitely advantageous to the surgeon and his patient provided that the incision be used with sufficient skill and care

Mr A H Southam, in an article in the *Journal* of February 14th, 1931 (p 258), quotes certain facts collected by Griffiths, Romanis, and Mitchiner to show that cases of inguinal hernia have followed the use (or abuse) of the McBurney technique I read Mr Southam's article and his recent letter (May 6th p 803) with appreciation and interest It is a warning, and a reasonable one to those who, like myself, wish to continue using a gridiron incision wherever possible without detriment to our patients Not so your correspondent in your issue of

LOCUMS.

FOR LOCUM TENENS APPLY TO PERCIVAL TURNER, Ltd.
The oldest and only Agent who for 50 years has supplied substitutes at short notice without fee to principals.

June 10th (p 1025) whose antagonism to this method knows no bounds

I saw recently an appalling ventral hernia occasioned by the use of a muscle splitting incision plus sepsis Exposure is not so good with a McBurney incision How painful these lateral abdominal incisions can be!

Nobody wishes to deny that evil results sometimes follow this operation but why invariably blame the incision for them? In the Mayo Clinic there is a well known syndrome for the recognition of gastro-jejunostomy sequels due to the anastomosis having been performed with the lower end of the ileum by mistake Yet even the most enthusiastic opponents of short circuiting would hesitate to use this as a valid argument

Mr F A R Stammers (April 29th p 763) Mr C A Moore (May 13th p 846) and Mr J W Geary Grant (May 20th p 892) give convincing testimony to the effect that gridiron incisions done by them do not result in cases of inguinal hernia I am glad to add my own results to these I have not seen any such hernia follow several hundred cases I now use this method exclusively for all definite cases of appendicitis with or without abscess or even general peritonitis and I have found complete satisfaction from its use I have had one case of post operative ventral hernia in a very obese woman of 52 with a gangrenous mass in the right iliac fossa and a pelvic abscess which necessitated prolonged drainage and extension of my incision across the posterior sheath of the rectus but I always regarded this case as my own fault not McBurney's as I deliberately sacrificed the abdominal wall for the patient's sake

As for pain in these incisions I have yet to see a case I think in fairness to my own choice I may quote three cases of Battle's incision in which the tenth dorsal or eleventh dorsal nerve has been involved in sutures resulting in persistent pain and a second operation to excise the affected portion This is not a legitimate ground of objection to Battle's incision the surgeon has himself to blame One surgeon of my acquaintance urged me to use this incision because he said one can in cases of mistaken diagnosis extend it upwards or downwards indefinitely as the case requires I make no comment on this except to say that the wrongly diagnosed case of perforated ulcer is probably better off in the hands of a surgeon who has started with a gridiron

I admit the gridiron incision requires care that it is the wrong operation for a novice and that if I were the subject of a budding surgeon's first operation I should ask him to do a Battle's incision but to those of us who have taken the trouble to learn our own limitations and still find a muscle splitting operation satisfactory let there be peace And let us be honest about our bad results and blame ourselves rather than the classical incisions we have misused —I am etc

Walmer June 11th JAMES S HALL

Aetiology of Acute Rheumatism

SIR —In the most useful discussion on the above subject in your columns one generally acknowledged factor (unless I am mistaken) has been overlooked—namely damp In the conference on rheumatism held at Bath some years ago under the auspices of the Ministry of Health the two causes of acute rheumatism which stood out prominently before all others particularly in the case of children were damp and infection—the damp of newly built houses of ill-drained localities and the like But if one went a step further and inquired how damp acts all sorts of views were encountered One expert would promptly say that it produced catarrh and thus prepared the soil for receiving infections another would contradict this and say that it fostered the growth of the infecting organism and others would again offer other explanations But the result of inquiries left one with the impression that the way in which damp acts as a cause had never really been investigated It must I think be admitted that when we have more certain knowledge of this point we shall be in a better position to lessen or prevent its extremely harmful effects —I am etc

Southsea June 5th M ASTON KEY

Raw and Pasteurized Milk

SIR —With regard to the letter (*Journal* May 27th p 937) in defence of the accuracy of some of the statements in Bulletin 5 of the Hannah Dairy Research Institute I do not consider it a good one The interesting chemical details concerning milk do not alter the fact that their statement that high grade milk was used throughout my work is incorrect My paper was written on raw milk and did not pretend to compare raw with pasteurized milk yet some comparison crept in It is quite true that I wrote

I am not aware of any comparable body of children who have been similarly brought up [meaning from birth or weaning] on sterilized or pasteurized milk and so have no exact knowledge whether effects comparable with those recorded might be brought about by such means but such evidence as is available and inference indicate rather that they would not be

As however my thesis did not concern comparison of raw and pasteurized milk such evidence and inference was not included save as in my letter in your issue of May 13th Incidentally too I have made no *claim* whatever about raw or pasteurized milk but merely published clinical evidence and the inferences I drew therefrom

Concerning the numbered paragraphs

1 Until evidence is available as to what ration of milk if any children aged from 9 to 14 years should have no one has any right to make dogmatic statements concerning any difference in the amounts of 12 and 20 oz a day respectively especially as at those ages milk is not a physiological food At the least if pasteurized milk produces effects apparently similar to those of raw milk one might reasonably expect the twenty three children receiving 12 oz a day to show a greater freedom from caries than others in the same school who did not receive it but they did not

2 The reference to inadequate numbers has here only a trifling if any significance as the resulting comparison showed very uniform and widely different incidences of caries in the specific tooth under observation and in a number of children under such conditions the omission of one child is entirely unjustifiable and irrelevant nor does it reverse the conclusions with regard to that specific tooth Even if that one child were omitted it would (in the children in that Table II) still leave the incidence of caries in the specific tooth observed as eleven for raw and sixty three for pasteurized milk and that is granting that that particular child had all four of its second permanent molars carious It was these points which prompted my remark that the comparisons had been missed otherwise it is incomprehensible why the essential point on which this comparison rested was omitted in the partial reproduction of Tables I and II in Bulletin 5 I certainly did not suggest that the authors were not competent as Blackwood and Wright state

3 Their remark here that a very large number of children receive raw milk in the United Kingdom is of course true but not relevant to the point at issue as I refer only to those receiving it (within my definition of raw) from weaning (or birth) to 2½ to 3 years of age and such children from the information of many others than myself I know to be extremely few indeed I have not seen another since the paper was written

The writers of the letter chide me for omitting reference to care cleanliness and irregularity in the spacing of the teeth and I will confess to omitting reference to many other potential *predisposing* factors which may affect the incidence of caries this was done because in the circumstances they appeared to have no relevance The recording

COUNTY BOROUGH OF BIRKENHEAD.

MEDICAL OFFICER'S DEPARTMENT.

MEDICAL SUPERINTENDENT.

Applications are invited from duly qualified Medical Practitioners, with personal experience in the administrative control of a public general hospital, for the post of Medical Superintendent of Birkenhead Infirmary, which Infirmary has been appropriated under the Public Health Acts.

The remuneration attached to the appointment will be £1,000 per annum, rising by biennial increments of £50 to a maximum of £1,100.

The Medical Superintendent will be required to reside within easy reach of the Infirmary. He will be an Assistant Medical Officer on the Staff of the Medical Officer of Health and will be responsible to the Medical Officer of Health, and through him to the Health Committee, for the control of the Infirmary, and for the supervision of the work of the Medical, Surgical, Nursing, and other personnel.

The Infirmary, which has accommodation for 547 patients, provides treatment for medical, surgical, and maternity cases, and has a staff of Resident Medical Officers and Visiting Specialists, and a Nursing Staff of 112.

The appointment will be made subject to the Local Government and Other Officers Superannuation Act, 1922, and is determinable by three calendar months' notice on either side.

Form of application and further particulars, relating to this appointment can be obtained from D. MORLEY MATHIESON, Esq., M.D., Medical Officer of Health, 9, Hamilton Square, Birkenhead.

Canvassing, directly or indirectly, will disqualify the applicant.

Applications, endorsed "Medical Superintendent," should reach the undersigned not later than Saturday, April 15th.

Town Hall, Birkenhead. March, 1933.

E. W. TAME,
Town Clerk.

URBAN DISTRICT OF OSWALDTWISTLE.

MEDICAL OFFICER OF HEALTH.

Applications are invited from duly qualified gentlemen for the appointment of a part-time Medical Officer of Health of the Urban District subject to the provisions of the Public Health (Officers) Act, 1921, and the Sanitary Officers Order, 1926.

The gentleman appointed will be required to perform all the duties imposed on a Medical Officer of Health and to carry out all such duties as the Council may with the consent (if necessary) of the Minister of Health from time to time direct.

He must reside in the district and will be allowed to engage in private practice.

The appointment will be subject to the approval of the Minister of Health.

The salary to cover all the duties specified above (other than duties in connection with the Isolation Hospital) will be £100 per annum, subject to a temporary deduction of 7½ per cent.

Applications, stating age, qualifications, and experience, and with two recent testimonials, must be sent to the undersigned not later than April 8th, and endorsed "Medical Officer."

Town Hall, Oswaldtwistle.

J. W. BOOTH,
Clerk to the Council.

MANCHESTER HOSPITAL FOR CONSUMPTION AND DISEASES OF THE THROAT AND CHEST.

Wanted, a RESIDENT for the In-patient Department (50 beds—Surgical and Medical). Bowdon, Cheshire. Must be registered. Salary £200 per annum, with board, apartments, laundry, and railway contract. Duties include attendance on three mornings a week at the Out-patient Department, Manchester.

Application, with copies of testimonials, to be sent not later than April 7th, to—

Hardman Street, Deansgate, Manchester, 3.

W. HUNT,
Secretary.

BUCHANAN HOSPITAL, ST. LEONARDS-ON-SEA.

A vacancy occurs on the Honorary Medical Staff for a PHYSICIAN in charge of the Department for Diseases of the Chest.

Applications, accompanied by copies of at least three recent testimonials, should be sent before Saturday, April 15th, to the undersigned from whom further particulars may be obtained.

S. C. W. DISNEY, Secretary.

MAIDENHEAD HOSPITAL.
(56 Beds.)

Applications are invited for the appointments of HONORARY CONSULTING PHYSICIAN and HONORARY CONSULTING GYNAECOLOGIST to the above Hospital. The Secretary, Maidenhead Hospital. Telephone: Maidenhead 1361.

CHARLES M. POWER, Secretary.

HERZL HOSPITAL, MOSER Leopold Street, LEEDS.

RESIDENT MEDICAL OFFICER required. Salary £200 per annum. Ample time for post-graduate study. Apply Secretary.

of the original incidence of caries was not very relevant to my thesis save to show that these children had been exposed to its *exciting* causes, or suffered from it, but it was referred to in Table III (forty children) and Table IV (thirty-three children) with exactness, and in Table V (twenty-eight children), in that "most of them had, or had had, carious deciduous teeth, up to nine still present in one mouth" The authors seem to have missed these points, only noticing them in three cases

It is unusual for a Southron (or rather two) to be accused from North of the Tweed of too much caution, but both Middleburgh and myself are careful what we write, and, seeing that I was up against something which amazed me by its very possibility, I said, in my opening paragraph

The decision whether the clinical facts recorded are caused by the associated circumstances can not be a personal one, but must ultimately depend on the experience and observation of many" Apparently the experience and observation of Blackwood and Wright permit them to make the more definite statement that "the merit of including raw milk in the diet of young children for the prevention or arrest of dental caries has already been demonstrated" I believe this to be true, provided the diet is otherwise well balanced and life is carried on on physiological lines

The writers are incorrect in presuming that I published all evidence available concerning pasteurized milk, I was not really discussing pasteurized milk save as concerned vitamin D and their charge of my neglecting what they regard as "the one outstanding feature" is also wide of the mark as for many years half of the 1,100 girls at A have had a pint of pasteurized milk daily, and I had that evidence—and other—before me, but it was not germane to my subject-matter—I am, etc,

EVELYN SPRAWSON

London Hospital Dental School May 31st

"Sunshine Roof" Rheumatism

SIR—Mr Donald Currie's letter on the subject of "sunshine roof' rheumatism is an extremely interesting example of the very direct localizing influence by climatic factors of fibrositis in possessors of the rheumatic diathesis It is somewhat unfashionable at the present time to particularize methods for the relief of what are believed to be mere symptoms of this sort, and I was relieved to read that the methods of cure adopted, and which were found by him effective were no more drastic than the wearing of a hat, a change in the driving position, and the injunction of an ointment locally I feel sure that certain more 'scientific" practitioners might, as a preliminary measure, have removed the patient's teeth, tonsils, and possibly appendix, before proceeding on the lines indicated by Mr Currie

It seems increasingly certain that the roots of the rheumatic diathesis, by which is meant the specific liability of certain persons to attacks of the disease, must no longer be looked for exclusively in the admittedly fertile soil of sepsis Diathesis, whether it be an inherited or acquired characteristic of "rheumatic" people, would seem to be in fact a physiological defect of the heat-regulating mechanism of their skin, an imperfect adaptation of their body to those changes in local environment which are now sometimes referred to as the "micro climate" of the individual in question When this state has been reached, treatment which has as its object the re education of the skin to this important function must be considered as being much more than palliative, whilst the eradication of any septic focus, although on general principles desirable, can no longer be considered at this stage to be of primary importance It is not sufficient to remove what may have been the original cause of diathesis it is the resulting physiological maladjustment of the body, where this is established, which becomes the primary indication for treatment—I am, etc,

London, W 1, June 10th W S C COPEMAN

I M S Pensions—"Not Guaranteed"

SIR,—On March 7th, 1932, Sir Samuel Hoare, Secretary of State for India, made the startling declaration that pensions of the officers of the Indian Medical Service were "not guaranteed" by the British Government This pronouncement was made in the face of the previously declared policy of the Indian Congress Party to the effect that on accession to power they would repudiate all debts contracted by the British Government otherwise than those in the interests of India, Congress being the *sole* judge of that question

Such ruthless abandonment of the rights of a large Service is inconsistent with British honour Several memorials were addressed to the Secretary of State, and he was also questioned in the House of Commons on the subject on March 7th, 1932, by Mr Kirkpatrick, on April 13th by Viscount Elmley, and on May 22nd by Sir A Knox But to the memorials and questions evasive replies were given without retraction of the "no guarantee" doctrine The following retrospect will show how fallacious that doctrine is

Under the Treaty of Paris England was acknowledged in 1814 to be the paramount power in India Act 16 and 17 Victoria, Caput 95 passed in 1853 substituted British rule for that of the East India Company and *inter alia* confirmed Britain's right of ruling in such matters as education and appointment of officials including the then so called assistant surgeons (Section XL) In 1858 Act 21 and 22 Caput 106 transferred the army and navy of the East India Company to the direct control of the British Government under Section LVI and authorized the payment of all expenses incidental to these forces from Indian revenues In 1858 also Her Majesty Queen Victoria issued her famous proclamation placing India directly under the Crown Royal commissions ('conferring rank in Her Majesty's Service in any part of the world') replaced East India Company's commissions for medical officers under paragraph 44 of dispatch from the Secretary of State for India dated November 7th 1864 Moreover in a number of Royal Warrants* issued subsequently the Government of India was debarred from interference with organization pay promotions and pensions of Indian Medical Service officers and these warrants were usually couched in such forcible language as "Our Viceroy and Governor General in Council etc, *shall be governed*" by the instructions contained therein To leave no doubt about these royal commissions to I M S officers, it was further ruled that notifications of promotions would be made in the *London Gazette*

One fact stands out clearly from this brief retrospect—the British Government *alone* is the employer of the Indian Medical Service, and consequently it cannot escape the position of guarantor of remuneration to its employees By the Act of 1858 it exercised the right to find that remuneration out of Indian revenues, but this in no way lessens its responsibility to continue to find funds for such remuneration, if not from Indian revenues (upon the grant of self-government to India), then from the British Exchequer

This letter raises no question of party politics My suggestion is that, relying upon the clanship of medical men, each one of the thousands scattered over Great Britain should putting aside his particular party creed, address an urgent letter to the member of Parliament for his area calling for a complete retraction of the Secretary

* Vide Royal Warrants dated May 10th 1873, November 16th 1880 May 20th 1881 July 6th 1881 April 30th 1887 May 28th 1913 etc quoted in full in Crawford's *History of the Indian Medical Service*

HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST, Brompton, S.W.3.

The Committee of Management invite applications for the following posts:

ASSISTANT RESIDENT MEDICAL OFFICER. Candidates must have held a resident hospital appointment for not less than six months. Salary £150 per annum, with board and residence. The appointment is for six months in the first instance.

HOUSE PHYSICIANS. There are three vacancies for House Physicians. The duties include work in the Out-patient Department as well as in the Wards, and one of the selected candidates will also be appointed Assistant to the Tuberculosis Officer for the Local Tuberculosis Dispensary at the Hospital. The appointment is for six months, commencing May 1st, with an honorarium of £50.

JUNIOR HOUSE PHYSICIAN (MALE) AT THE SANATORIUM AT FRIMLEY. The appointment is for six months, commencing May 1st, with an honorarium of £50. At the expiration of his term of office, or in the event of a vacancy, the Junior House Physician will be expected to apply for, and, if appointed, to hold the post of Senior House Physician for a further term of six months.

Applications, with copies of testimonials, must reach the undersigned not later than Saturday, April 8th.

Brompton, March, 1933. FREDERICK WOOD, Secretary.

LONDON HOMOEOPATHIC HOSPITAL, Great Ormond Street and Queen Square, Bloomsbury, W.C.1.

The Board of Management invite applications, male or female, for the following appointment: SURGEON FOR DISEASES OF THE EYE.

The successful candidate must possess a registrable University degree and the Fellowship of one of the Royal Colleges of Surgeons or one of the higher qualifications in Ophthalmology, and must be or become a Member of the British Homoeopathic Society. Candidates are requested to state whether, in the event of one of the present Assistant Surgeons being appointed to the post, they would be willing to accept, if elected, the post of Assistant Surgeon for Diseases of the Eye. Any candidates canvassing the members of the Board are thereby disqualified.

Candidates will be required to attend a meeting of the Medical Committee.

Applications, stating age, with thirty-five copies of application and thirty-five copies of each testimonial, should be sent addressed to the Secretary, of whom further particulars may be obtained.

EDWARD A. ATTWOOD, Secretary.

THE CANCER HOSPITAL (FREE) (Incorporated under Royal Charter), Fulham Road, London, S.W.3.

The Committee are prepared to receive applications for the post of HOUSE SURGEON to commence duties on May 1st. Salary at the rate of £100 per annum.

The appointment is for six months, and subject to rules.

Candidates must call upon each member of the Medical Committee not later than Tuesday, April 18th.

A copy of the rules and the names and addresses of the Medical Committee may be obtained from the Secretary.

Previous experience as a House Surgeon is indispensable.

Applications, with three (copies only) testimonials, to be sent to the Secretary not later than the first post on Saturday, April 8th.

THE CANCER HOSPITAL (FREE) (Incorporated under Royal Charter), Fulham Road, London, S.W.3.

The Committee are prepared to receive applications for the post of CLINICAL PATHOLOGIST to the Hospital.

Experience in Clinical Pathology is essential. Salary £850 per annum.

The appointment is subject to rules, a copy of which can be obtained from the Secretary. Applications, accompanied by copies of not more than three recent testimonials, to be sent to the Secretary not later than Thursday, April 13th.

The Assistant Pathologist is a candidate for the post, and in the event of her being appointed a vacancy for an Assistant Pathologist will occur, for which applications are now invited. The salary attached to this post is £500 per annum.

ROYAL NORTHERN INFIRMARY, INVERNESS. (150 Beds.)

HOUSE SURGEON (male) wanted to commence duty on May 1st. The appointment is for six months. Salary at the rate of £100 a year, with board, residence, and laundry.

Applications, stating age, qualifications, etc., with copies of recent testimonials, to be sent not later than April 15th to ROBERT GILBERT, Hon. Secretary, 20, Church Street, Inverness.

WEST LONDON HOSPITAL, Hammersmith, W.6. (234 Beds.)

Required, ONE NON-RESIDENT HOUSE OFFICER (part-time) for Children's Department for six months from May 1st next, subject to one month's notice on either side. Applicants may be male or female. Salary at the rate of £150 per annum. Candidates must be registered under the Medical Act and have held a resident appointment at a Children's Hospital or in the Children's Department of a General Hospital.

Applications and copies of testimonials in quadruplicate (which must be made on printed forms obtained from me) must reach me not later than first post on Friday, April 21st. Selected candidates will be required to call upon such members of the Medical Staff as directed, to be in attendance at a Meeting of the Medical Council on Friday, April 28th, at 4.30 p.m. and the House Committee Meeting at 5 p.m. the same day, when the appointment will be made.

H. A. MADGE, Secretary.

of State's no guarantee doctrine in regard to Indian Medical Service pensions A leading British politician not reputed to possess a personal fund acknowledges risk in giving India self government The nature of that risk may be gauged by clear thinking men (*pace* Lord Irwin) in the refusal of British insurance offices to accept proposals What the India Office thinks about that risk may be guessed from the fact that from 1853 to 1919 the Secretary of State for India was paid out of Indian revenues But on the near approach of self government to India a safeguarding section appeared in the 1919 Government of India Act allowing the Secretary of State to obtain his salary from British revenues Five years later in 1924 under the amendments to the 1919 Act his under secretaries might be paid out of the revenues of India or out of moneys provided by Parliament [Part I Section 2 (3)] The India Office has thus guarded against all risk of repudiation of debts by a future Government of India by a safety first formula for itself but has no scruples in abandoning the just and hard earned rights of hundreds of our medical brethren and countrymen —I am etc

A Giant Prostate

SIR —Mr Holman is to be congratulated on the successful outcome of his operation on the giant prostate described in your issue of March 4th (p 366) The record as far as mere size is concerned seems to be held by the prostate exhibited by Neupert at a meeting of the Berliner Gesellschaft für Chirurgie in January 1931 (*Zentralbl f Chir* 1931 Nr 17 s 1071) This tumour which extended nearly to the umbilicus and was larger than a man's head weighed 3 600 grams (approx 8 lb) The patient a 67 year-old man had noticed it for ten years An attempt at removal had to be abandoned owing to haemorrhage The patient died on the following day Histologically the tumour was reported to be a benign myoma of the prostate —I am etc

Medico-Legal

SPARING THE MEDICAL WITNESS

In the case of *Manikum* v *Ace of Spades Petrpleum Company* tried by Mr Justice Swift under the New Procedure Rules, the plaintiff M claimed damages for wrongful assault by the servants of the company He was one of a party which visited a restaurant kept by the company on the Kingston by-pass A member of the party became troublesome and involved himself in an undignified quarrel with the waiters, with the result that the party was asked to leave The other members left, but the excited membo refused to go and M stayed behind to persuade him to leave peaceably The staff, in accordance with their legal right, began to eject these two men Owing to the resistance they encountered from the troublesome member, and also owing to the provocation they had received, they were by this time very angry, and not content with ejecting the two, some of them held M and others struck him repeatedly in the face and on the head, inflicting severe injuries Both his eyes were blackened and he had several cuts on the face, he had a compound comminuted fracture of the nasal bone, which has left a permanent deformity, with the blocking of one nostril he had five teeth broken in the alveolus and a fracture of the maxilla and palate, two other teeth which became septic as a result of the injury had to be removed He had previously had perfect teeth The company owning the restaurant attempted to prove that its servants had used only a proper and necessary amount of force, and that M had received his injuries by falling face downwards as a result of being tripped up by some unknown guest who joined in the fracas, either on to a concrete floor or else on to an ornamental wooden tub bound with metal The extent and nature of the injuries were not disputed M called the doctor and dentist who had attended him, and the company called the consulting surgeon to whom M s general practitioner had taken him The only difference in this expert evidence concerned the possible cause of the injuries The dentist's first impression was that his patient had been in an explosion The general practitioner said that in his opinion these were not the sort of injuries received by a man pitching headlong on his face on a concrete pavement, because there was evidence of blows from a number of directions Nor did he think it possible that the injuries could have been inflicted by one man unless the aggressor had walked round the victim and delivered the blows from at least four different angles He thought there was evidence of blows both from a fist and also from some such instrument as a bottle or knuckle duster, producing the punctured wounds The surgeon was alleged to have said at the time to the general practitioner that the man must have been the victim of a brutal assault In the witness box, however, he could not remember whether he had made this remark or not, but in reply to the judge's question as to what he had thought, even if he could not remember what he had said, he admitted that a very great deal of violence must have been used, but at the same time he thought a fall on a concrete surface was a likely cause In replying again to the judge he agreed that a fall would not account for bruises on the back of the head, but he could find in his notes no reference to such bruises He had seen the patient a fortnight after the event

Before the medical evidence was heard Mr Justice Swift inquired of counsel why it had not been agreed in this case, and at the conclusion of the surgeon s evidence he repeated his question, remarking that it seemed to him most undesirable that medical men should be kept from their duties for long hours when there was, so far as he could see absolutely no conflict of evidence in any material particular The only point on which the doctors differed was the method by which the agreed injuries had been inflicted, and, with all respect to the medical men he considered that he was just as competent as any doctor to form an opinion as to whether the injuries described to him had been the result of a fall or of an assault In this case he certainly did not accept the suggestion that what he described as the "very dreadful facial injuries" had been caused by a fall, and he awarded M £413 19s 6d damages and costs against the company

One of the chief aims of the New Procedure is to reduce the amount of evidence given in court by witnesses The judge has wide powers to order that any particular facts may be proved by affidavit instead of by the calling of witnesses, and he can refer any question that involves expert knowledge to a special referee for inquiry and report He can also order that no more than a specified number of expert witnesses shall be called This was obviously a case in which the medical evidence could have been agreed and proved by affidavit, the report of one medical man being countersigned by the others and the question of the causation of the injury being left to the other witnesses In this way the time of three busy practitioners would have been saved The learned judge did not see fit to mark his disapproval by making any special order as to costs The company, in accordance with ordinary practice, has to pay the costs of the plaintiff M, but if the judge had considered that M had called unnecessary medical evidence, he could have ordered M to pay the costs of this evidence There is a special provision in the New Procedure that when an injury is alleged to have been caused by the negligence of a party, the judge may refer to a special referee any question concerning the nature, extent, and permanence of that injury The expert's report is communicated to both parties who may accept it in whole or in part This rule will undoubtedly save much trouble and expense in the road accident cases for which it was framed As, however, the injuries in the present case were not caused by negligence but by wilful assault, presumably the judge could not have exercised the power to refer them to a special referee under this sub rule There does not seem to be any point in differentiating between negligence and wilfulness in the causation of injury, and when the Rules Committee considers the amendment of this experimental procedure they may pay attention to this matter along with many others

British Medical Bureau

(THE SCHOLASTIC, CLERICAL & MEDICAL ASSOCIATION LTD.)
(FOUNDED 1880.)

12, Stratford Place,
Oxford Street, W.1.

Tele. Address: Triform, Wesdo—London.
Telephone: Mayfair { 1782 / 1783

The Association has long been favourably known to the members of the Medical Profession as a thoroughly trustworthy and successful Agency for the transaction of every description of Medical, Scholastic and Accountancy business, and the BRITISH MEDICAL ASSOCIATION has every confidence in recommending its members to consult Mr. A. V. STOREY, the General Manager, in all transactions requiring the services of a Medical Agent.

Members of the British Medical Association may take advantage of a reduced scale of charges applicable to them.

The business undertaken by the British Medical Bureau is divided under the following heads:—

TRANSFER OF PRACTICES, PARTNERSHIPS, etc.

Medical Practitioners wishing to dispose of Practices, or desiring to take Partners, are advised to negotiate the business through the British Medical Bureau. Vendors may depend upon receiving introductions only to eligible and bona-fide purchasers. All information is treated in strictest confidence. Full and trustworthy information regarding Practices, Partnerships, etc., for disposal, supplied gratis to Purchasers.

ASSISTANTS AND LOCUM TENENS.

Assistants and Locum Tenens can be secured at short notice. It is the foremost aim of the British Medical Bureau to ensure that only the most Trustworthy and Reliable Locums and Assistants are sent out.

RESIDENT PATIENTS.

Medical Men wishing to receive Resident Patients should enrol their names on the books of the British Medical Bureau. A large number of Patients are placed yearly through this medium.

ACCOUNTANCY.

The British Medical Bureau has its own staff of qualified Accountants wholly engaged on medical work—i.e., Investigation of Practices for purchasers, Income Tax, Auditing Accounts, etc.

Practices and Partnerships for Disposal. **Full particulars sent free.**

1 KENT.—PARTNERSHIP IN MIDDLE AND WORKING-CLASS Practice averaging nearly £4,450 p.a., in an industrial Town under 25 miles of London. Panel about 2,600. Detached house (4 bedrooms) with garden to rent. Plenty of scope for increase. Premium one fifth share 2 years' purchase.

16 LONDON, W.—STEADILY INCREASING NUCLEUS OF PRACtice in the Maida Vale district. Bookings for 11 months £249, of which about £100 has been received. Rent of consulting and waiting rooms 30/- weekly. Good scope. Premium £300.

Obituary

SIR WALTER FLETCHER K B E C B M D LI D D Sc F R C P F R S

Secretary of the Medical Research Council

Sir Walter Fletcher s death on June 7th after an operation is a great loss to the country and to medical science The establishment of a Medical Research Fund under the first National Health Insurance Act and the constitution of the Medical Research Committee set up in 1913 to administer it were largely due to the vision and driving force of Sir Robert Morant The choice of Fletcher as chief executive officer and guiding spirit of the new committee (reconstituted in 1920 as the Medical Research Council) was singularly happy and holding the same high ideals Morant and Fletcher worked in close alliance to put the scheme on right foundations The eager forward looking minds of these two men were attuned they were passionate in their devotion to the public weal and the debt of medical research to them is incalculable

Walter Morley Fletcher sixth son of Alfred Evans Fletcher was born in Liverpool on July 21st 1873 He went up to Trinity College Cambridge with a scholarship and graduated B A with first class honours in the Natural Sciences Tripos of 1894 As a university athlete he followed in the footsteps of his elder brother Dr Herbert Morley Fletcher Continuing his physiological work at Cambridge he was elected Coutts Trotter student in 1896 and won the Walsingham medal and was elected a Fellow in the following year He then entered St Bartholomew s Hospital with an open scholarship After taking his M B in 1900 he returned to Cambridge as Fellow and lecturer at Trinity and for two years was senior demonstrator in the University physiological laboratory From 1904 to 1914 he was tutor at Trinity He proceeded M D in 1908 and obtained the Sc D degree in 1914 just before coming to London as Secretary of the Medical Research Committee which had recently been set up under the chairmanship of Lord Moulton He was elected F R S in 1915 largely in recognition of researches on the biochemistry of muscular contraction a subject to which he devoted his Croonian Lecture that year

Immediately after the outbreak of war Fletcher put the resources of the new research organization at the disposal of the Admiralty and the War Office and with characteristic zeal threw himself into the many and diverse medical problems that arose He was a member of the Army Pathological Advisory Committee and of the R A F Medical Advisory Committee and after the armistice of the Pensions Disability Committee He also became medical assessor to the University Grants Committee and served on the Royal Commission on Oxford and Cambridge Universities (1919–22) In 1928 he visited India as chairman of the Committee on the Organization of Medical Research under the Government of India In the course of his ever widening administrative and advisory duties as Secretary of the Medical Research Council Fletcher s influence made itself felt in laboratories and research institutes wherever investigations were projected or in progress that might advance medical knowledge or promote the national health To everything that he took in hand he applied the whole force of a first rate intellectual equipment and the unquenchable ardour of a reformer If ever a man could be described as irreplaceable that man was Walter Fletcher

Honours accumulated in the course of years the Universities of Edinburgh Glasgow Birmingham and Pennsylvania made him an honorary LL D and the Universities of Oxford and Leeds an honorary D Sc In recognition of his services during the war he was created K B.E in 1918 and for his work in the organization of medical research in India he received the C B in 1929 The Royal College of Physicians of London elected him a Fellow in 1918 under By law XXXVIII (*b*) and he was an Honorary Freeman of the Society of Apothecaries

Walter Fletcher belonged to that rare class of men who combine wide culture with singleness of purpose and scientific vision with great organizing ability An idealist he pursued realities He was quick as he saw the drift of new work to look for its bearing upon practical problems Generous impulsive and critical by temperament he fought many battles for causes and for friends but none for his own advantage Very formidable as an opponent on questions of public policy he was a charming and witty companion in social life and all who had the privilege of his friendship feel that a unique personality has passed from among them

At the funeral service in Trinity College Chapel on June 10th the Council of the British Medical Association was represented by Mr H S Souttar Deputy Chairman of the Representative Body and at the memorial service in St. Martin in the Fields on June 12th by Mr Souttar and the Editor of the *Journal*

Sir HENRY DALE writes

Many will have pondered during the past few days on all that medical research in this country and far indeed beyond it has gained from the chance which nineteen years ago brought the man and the opportunity together Walter Fletcher had then already left a permanent impress on physiology in particular not only by the earlier research on record in his own name but even more by his inspiring term of office as a tutor of Trinity At the end of that period he might still in the full vigour of early middle life have returned to personal research at the

44 LONDON, E.—CASH AND PANEL PRACTICE OF £860 P.A. in populous district. Panel 570. Small house to rent on lease. Premium 1½ years' purchase.

"MEDICAL PARTNERSHIPS, TRANSFER, AND ASSISTANTSHIPS" (BARNARD & STOCKER). *Post free* 12/6.

All communications to be addressed to Mr. A. V. STOREY, General Manager.

laboratory bench Had he done so there can be no doubt that he would have produced further work of great distinction in the field of his choice , for he certainly had most of the qualities of the great investigator—a vigorous and logical mind, a quick imagination, prompt to see new possibilities of causal relation, an exacting standard of precision in action and thought, and a tireless curiosity But it cannot be doubted that he made a greater and more permanent gift to science, and to medical science in particular, by devoting the remainder of his life to providing opportunity for research to be carried out by others To this task he brought a first-hand knowledge of the meaning and needs of research, in rare alliance with a personality of remarkable charm and distinction, and with a natural gift for the handling of men and affairs Without Fletcher as its secretary the Medical Research Fund would, no doubt, have been faithfully administered, to provide helpful subventions for the researches of many, and full-time opportunity for a chosen few No committee, however, with a merely administrative secretary, could have made it the transforming influence in medical research which it became It may be doubted whether, under such conditions, it would have moved from its original relation to the national insurance scheme or have grown beyond its original dimensions

Having accepted the opportunity, Fletcher became far more than the executive officer, administering the Fund in accordance with the Committee s and later the Council's decisions From the first his administration was carried out on extraordinarily personal lines He became the friend and counsellor of every worker whose researches the Fund could help and, as time went on, of many others who needed no pecuniary aid His eager mind was always seeking new directions, in which material difficulties could be removed from some already promising line of investigation, or in which some new quest could be stimulated by an offer of support Men came from centres of research all over the country, not merely to enlist his interest with a view to financial support, but to submit new ideas to his keen and critical judgement, to take his advice on matters of planning and administration, or to seek his help and sympathy in personal difficulties An analysis of the calendar of appointments in his office would surely exhibit an amazing variety of obligations cheerfully accepted The fame of his ability and his wisdom went round the world It was natural that the Indian Government should invite him to preside over its Commission of Inquiry on Medical Research His name was as familiar to those concerned with the organization of support to medical research in the United States of America as in the British Oversea Dominions At home his influence spread far beyond the limits of the strictly medical field, and was effective at numerous points where Government action made contact with the applied biological sciences

Fletcher had a large circle of devoted friends, and the range of his personal contacts was wide and influential Probably no man s advice was so widely sought as to the best method of applying funds which had been left in trust or which it was intended to give, for the support of research I do not think that there was any case in which he used such opportunity to bring additional funds under the direct control of the Council and of his own administration it was other institutions rather—the Royal Society the universities, and hospitals—which, on such occasions, received the powerful aid of his advocacy Such funds as came to the Council from outside benefactors came unsought, attracted by the reputation for enlightened administration which Fletcher's work had done so much to establish For the position and the rights of the Council, on the other hand he could be forceful and insistent to a length which some mistook for arrogance, till they came to know the generous heart of the man and to realize that he was fighting for what to him was a sacred cause, and not for a moment for his personal position or prestige

The cause was that of research and of the genuine research workers How often have I heard him with obvious sincerity, depreciate his own activities, in comparison with those of the men and women who were engaged in the work of directly adding to knowledge With his position of growing influence and distinction, with all the calls on his attention of large and important schemes, he always had time to spare for the humblest genuine research worker and kindly encouragement to give He was at his best and happiest in friendly interchange with bright and eager young minds , and to any with a story to tell of new observations made, or of new ideas yet to be brought to the test of experiments, he was always ready to give the true encouragement of a really critical interest No perfunctory compliments from Fletcher , you had to make clear to his quick impatience exactly what you were doing and why you were doing just that and why the suggestions which darted from his alert intelligence were not appropriate And then came the reward of his boyish pleasure, and his insistence on the importance of the work, and his eagerness to help its progress To every worker in medical research he was a friend and a champion

SIR FRANCIS FREMANTLE writes

Sir Walter Fletcher s varied qualities and activities have been well described in the press , and with it the greatness of conception and of opportunity which enabled him to make of the Medical Research Council " one of the most distinguished and useful bodies in the Empire " But his achievement is of great value in even wider fields When one penny out of the weekly contributions was set apart for research work in the Insurance Act of 1911 there was a serious danger that it would be used for petty laboratory work on narrow and established lines under official regulation and control Thanks to Lord Moulton, Lord Rhondda, and others, this danger was averted, and Sir Walter Fletcher made good Curative and preventive work, private practice, institutional service and the public health, each had their new and progressive contributions to make and requirements to ask of medical research All had to be included in the scheme The resources and funds of public authorities, not merely of the new insurance committees, were required no less than those of charity and private enterprise Above all, the individual freedom of the worker in body, mind, and soul was as essential as the co operation and guidance along useful lines which enabled them to conceive a purpose in their work as an integral part of the whole campaign of discovery The Medical Research Council was thus evolved under the cloistered protection of the Privy Council, to serve the Government in all its departments , and not under any one department, where it might be influenced by political necessity or parliamentary pressure and have its reports edited or curtailed A synthesis has thus been effected between the needs of the public and of the individual , between individual freedom and communal rights and resources (the essences of conservative and socialist philosophies) , between prevention and cure , between old and established lines of thought and work and the new ideas, machinery, and opportunities now opening to a new world May it be as our profession should always be, an example for the reconstruction of the national machinery and government, and an enduring monument to one of the most versatile and ablest of our contemporaries

BOVRIL MEDICAL AGENCY, Ltd.

ALDINE HOUSE,

10-13, BEDFORD STREET, STRAND, LONDON, W.C.2.

Telegrams: BOVMEDICAL, LESQUARE-LONDON. Telephone: TEMPLE BAR 1616 (3 Lines).

Under the personal directorship of Dr. J. FIELD HALL and J. C. NEEDES

who have both had many years' experience as Medical Transfer Agents.

The commission chargeable in respect of any practice or partnership in Great Britain placed exclusively in the hands of this Agency has been fixed on an exceptionally favourable scale, the maximum chargeable on any transfer being fifty pounds (£50). Full Schedule of Terms and Conditions will be forwarded on application.

Accountancy and legal services furnished by the Agency, where desired, at moderate inclusive charges. No charge is made to Principals for the introduction of Locum Tenens or Assistants.

1. PARTNERSHIP.—In a well-populated pleasant South-Eastern suburb, within ten miles of London, the half share of an old-established mixed class Practice is for disposal owing to the retirement of the junior partner. Held by the remaining partner 30 years. Cash receipts average £2,765 p.a., including panel of 1,800 and appts. worth £150. Very little midwifery. Pleasant semi-detached corner house, with ample accommodation, garden. Price, leasehold (over 900 years, at ground rent of £7 p.a.), £1,050. Premium 2 years' purchase. Scottish graduate preferred.

2. NORTH-EAST COAST.—FAVOURITE TOWN.—Old-established good mixed general Practice, offering considerable scope for increase. Gross cash receipts for the past twelve months approximately £1,800. Selected panel of 100. Fees 5/- to 7/6. Very little midwifery. Well-situated house, with 3 reception, 5 to 6 bedrooms, etc., and separate professional rooms. Electric light. Garage. Price for Practice and house £5,400, part on mortgage. Good opportunity for Eye work, and Ear, Nose, and Throat work if desired. Sport of all kinds and excellent schools.

3. LANCASHIRE. — Well-established PRACTICE, situated in pleasant agricultural district, within easy reach of neighbouring towns, and Lake district. Gross cash receipts average about £1,200 p.a., and Practice is steadily increasing. Fees 3/6 to 10/-, visits 5/-, with medicine extra. Midwifery not encouraged. Suitable house, with 2 reception rooms, 5 bedrooms, and two large attics, bathroom, etc., consulting and waiting rooms. Electric light. Good garage. One acre of ground. Can be rented on lease. Premium 1½ years' purchase.

4. MANCHESTER.—Old-established middle and working-class PRACTICE, producing for the last twelve months about £650, including panel of 790. Fees from 3/6. Convenient house, with 2 reception, 4 to 5 bedrooms bathroom, etc. Rent on lease £60. Premium £950, to include furniture.

5. LONDON, NORTH-WEST. — Middle-class PRACTICE, in new and developing district, producing last year £400 and this year at the rate of about £600. Panel of 230. Fees 2/6 and 3/6, visits from 5/-. Six-roomed house, with bathroom, electric light. Garage. Garden. Price for freehold £1,000, £850 on mortgage. Prem. £650.

6. LONDON, SOUTH-WEST.—Old-established middle and working-class PRACTICE, producing about £1,100 p.a., including panel of about 1,150. Visits 3/6 to 5/-. Suitable corner house, with 2 reception, 4 bedrooms, bathroom, and separate professional accommodation. Can be rented on lease. Premium £1,750. Easily worked, and offering very good scope for increase.

7. SOUTH-WEST OF ENGLAND.—In a thriving and pleasant seaport town, with beautiful surrounding country, a well-established increasing PRACTICE worth last year over £1,100, including panel producing £286 and appts. £200. Visits 3/6 to 21/-. Midwifery practically refused. House is Vendor's property and is for sale. Premium £2,000, or near offer.

8. WITHIN SIXTEEN MILES OF LONDON.—Small PRACTICE, offering large scope in good residential town. Receipts estimated to be between £500 and £600 p.a. Good house. Price for Practice and house £4,000, or near offer.

9. PARTNERSHIP. — NEAR EPPING FOREST. — A one-third share is offered in a well-established and rapidly developing good middle-class Practice, averaging for the past three years £3,504, including appointments worth £250. Selected panel of 660. Good house available (professional accommodation, 3 reception, 5 bedrooms, etc.). Large and secluded garden. Garage. Freehold for sale, or might be rented. Premium 2 years' purchase.

10. LANCASHIRE.—LARGE TOWN.—Old-established chiefly working-class PRACTICE, averaging for the last three years nearly £1,900. Panel of 2,950. Advice and medicine from 3/6. Surgery can be rented at £55 p.a. Premium £3,000, or near offer.

11. LIVERPOOL.—Well-established PRACTICE in rapidly growing district, Gross cash receipts over £950, including panel of 876. Fees from 2/6. Suitable house can be rented at £80 p.a. Premium 1½ years' purchase.

12. WITHIN FIFTEEN MILES OF LONDON.—Old-established better middle and working-class PRACTICE, producing last year £1,536, of which £689 is from panel. Fees 2/6 to 7/6. Midwifery discouraged. Large house in one acre of ground, with ample accommodation. Price (freehold) £4,750 (£2,750 on mortgage or might be rented). Premium £2,500. Very good scope for increase.

13. MIDDLESEX.—ASSISTANTSHIP, with view to Partnership offered in a large mixed general Practice, after a preliminary period of six months. Ingoing partner must be English and experienced.

14. SOUTH-EAST LONDON.—Good middle and working-class PRACTICE, producing last twelve months nearly £950. Panel of 986. Suitable house, with 2 reception, 4 to 5 bedrooms, etc. Rent on lease £70 p.a. Premium, to include drugs, etc., and surgery fittings and furniture, £1,450.

15. HOME COUNTIES.—ASSISTANTSHIP, with view to Partnership offered in a better-class Practice in residential town. Ingoing partner must have experience of general Practice and be able to undertake major surgery, and preferably hold a Fellowship.

16. NORTH WALES.—Old-established middle and working-class PRACTICE, averaging for the last three years over £1,700, with panel of about 1,300. Fees from 2/6. Visits from 3/6, with medicine extra. Suitable house, with good professional accommodation. Electric light. Garage for two cars. Small garden. Rent on lease £100 p.a. Premium £2,500, £1,700 down, balance by instalments. Good sport, etc. A knowledge of Welsh is not necessary.

17. PARTNERSHIP.—CHESHIRE.—Half share (producing over £2,000 p.a.) of very old-established Practice, situated in most pleasant residential district within few miles of a large town, can be acquired by an experienced gentleman between 35 and 40 years of age. Panel of 1,200—1,300. Patients all classes. Fees good and expenses light. Suitable house available containing 2 reception rooms, 3 bedrooms and 3 attic bedrooms, bathroom, etc. Garage and garden. Rent £65 p.a. Premium £4,000. Every social amenity, sport, and very good educational facilities.

18. RIVIERA.—Old-established PRACTICE the receipts from which have averaged over £1,600 p.a., but have decreased recently owing to Vendor's ill-health. Very good prospects of extension. Fees from £1 1s. Very easy work. Suitable flat can be rented at £100 p.a. Premium £4,000.

19. MIDLANDS.—Old-established middle and better-class PRACTICE in clean and attractive manufacturing city. Cash receipts average over £1,600 p.a., including appt. worth £165 (transferable) and panel of 1,220. Visits 5/- to 2 gns. Midwifery discouraged, fee 5 to 15 gns. Exceptionally good house, in its own grounds, with ample accommodation; fitted with every labour-saving device, and economically run. Situated in the best residential part. A cottage in the grounds is let at £37 a year. Price, freehold, £5,000 (£3,500 on mortgage). Premium £3,500. Scope for active man.

20. WESTERN SUBURB.—Well-established PRACTICE, producing £950 p.a., including panel of nearly 600. Suitable house available. Premium 1½ years' purchase.

21. LANCS.—Well-established mixed-class PRACTICE, producing for the last 12 months £725. Panel of 1,055. Fees from 3/6. House contains 3 reception, 5 bedrooms, etc. Rent on lease £85 p.a. Premium 1½ years' purchase.

22. LANCS. — LARGE TOWN. — Old-established upper and middle class PRACTICE, situated in purely residential district and averaging about £1,700 p.a. including appts. of £130, and panel of 700. Visits 5/- upwards. Very little midwifery at 5 to 10 guineas. Expenses low. Excellent and well-built house, ideally situated, having ample accommodation (surgery, waiting room, and dispensary, 3 reception, 5 bedrooms, etc.). Rent on lease £120. Premium £2,500. Good educational facilities.

23. EGYPT.—Well-established PRACTICE, producing about £950 p.a., and offering good scope for increase. Fees 10/6 to 2 guineas. Excellent accommodation can be rented at £16 10s. monthly. Premium to include all furniture, drugs, drug bottles, instruments, etc., £2,000.

ASSISTANTS REQUIRED.—(1) BRISTOL. Outdoor, £350 p.a., all found. Scottish graduate preferred. Must be single. (2) LONDON. Indoor, £300 p.a. (3) LONDON, S.E. Indoor, £300 p.a. (4) LONDON, EAST. Indoor, with view to Partnership. £300 p.a. capital for purchase of house and Practice. (5) YORKSHIRE. Outdoor, £300 p.a., all found. Single, aged 21 to 30. English or Scot, and willing to cycle. (6) STAFFS. Outdoor, £450 p.a. Must provide own car.

WANTED TO PURCHASE.

1. OUTLYING SUBURB.—Middle and working-class PRACTICE, producing in about £1,500 p.a., with panel of 1,000 upwards. Must have house and garden. Capital available.
2. BUCKS, BERKS, or near locality.—Better-class PRACTICE, averaging about £1,500 p.a., with good scope. Panel not necessary. Apply capital for purchase of house and Practice.
3. SOUTH OF ENGLAND.—Good town, with educational facilities. Income £1,200 to £1,800, with substantial panel. Fair-sized house with garden.
4. SOUTH COAST TOWN, or near locality.—PRACTICE averaging about £1,500 p.a., with panel of 1,000 or thereabouts. Small house preferably on rental. Capital available.
5. LONDON OR SUBURBS.—PRACTICE, producing £1,400 to £1,600 p.a., with panel of 1,500. Good house, with garden.
6. COUNTRY PRACTICE, within 60 to 80 miles of London. Income from £1,000 upwards.
7. PRACTICE or PARTNERSHIP, suitable for LADY DOCTOR, within easy reach of London. Income approximately £300. Capital available.

The Agency has made arrangements for special facilities, on very favourable terms, to be afforded to approved purchasers for the advance of part of the premium for any suitable practice or partnership. Full details on application.

J A SHAW MACKENZIE M D

Dr John Alexander Shaw Mackenzie died suddenly on June 1st at the age of 75 A correspondent J T C sends the following appreciation

Few have laboured more consistently to ascertain and to use for the benefit of mankind the defensive factors against cancer normally existing in the blood and tissues His whole mind was absorbed in the subject and he sacrificed his professional life to this cause He built up his work not on theories but on laboratory experiment working at King's College the Imperial Cancer Research Fund and both the Brown Institution and the Ross Institute

Dr Shaw Mackenzie began work on the subject of cancer in about 1900 and was much interested by the olive oil soap treatment introduced by Dr J H Webb of Melbourne in 1905 By 1907 he published a work on the peptone splitting ferment erepsin and in 1909 began to give his attention to the fat splitting ferment lipase From his experiments on ferments or enzymes he built up the hypothesis that the cells in cancer proliferate without control because the normal tissue or intracellular enzymes are deficient either in quantity or quality He found that a definite quantity of normal serum had an accelerating effect on certain enzymes whereas the same quantity of cancer serum had an inhibiting effect He used these facts for two of his tests His lipolytic test showed the amount of fatty acids liberated from a neutral olive oil emulsion by lipase these fatty acids being increased by normal serum but diminished by that from cancer patients His tryptic test was similar normal serum diminishes the power of trypsin to digest protein whereas the serum from a cancer case inhibits it more He claimed that these two tests together gave 95 5 per cent correct results His third test consisted in a turbidity produced in cancer serum by a saponified mixed extract of cancer tissues and this he claimed gave a 95 3 per cent correct result in gastric and duodenal cases His treatment which required careful administration was made up of the injection of olive oil soap into the tissues or veins and the administration by the mouth of dried bile and of certain enzymes especially secretin in order to stimulate intracellular enzyme formation and correct the deficiency His reasoning did not exclude the possibility of organisms being the cause of cancer he spoke of cancer houses but he doubted if organisms were the cause or an effect of the disease He claimed that his treatment diminished the risk of recurrence after operation lessened pain stopped fetor prolonged life and in some cases gave a complete cure Many of his cases showed remarkable results and he thought that thousands might have their lives prolonged by his methods

He had held the appointments of medical registrar and pathologist to the Victoria Hospital for Children assistant physician and pathologist to the Chelsea Hospital for Women and physician to the Women and Children's Heart Hospital Soho Square but the tragedy of his life was that in 1900 after being elected an out patient physician to the Samaritan Hospital his services were suddenly dispensed with This was explained and Shaw Mackenzie fully vindicated by Dr A W Oxford in his book on the history of the Samaritan Hospital of which he was chairman He wrote thirty years after the event Although not stated in the minutes this was on account of supposed unorthodox views on the subject of cancer which seem now to meet with some support Shaw Mackenzie suffered from not having his work thoroughly investigated according to his own ideas but in spite of this he pursued steadily the experimental path that he believed would best achieve his aim

GERVASE DIS EY ALEXANDER (eleventh Lord COBHAM, who died on June 10th in St Thomas's Hospital after an operation was born on May 6th 1880 eldest son of the late Reginald Gervase Alexander M D of Halifax From Gonville and Caius College Cambridge where he graduated B A in 1903 he went to St Thomas's Hospital qualifying M R C S L R C P in 1906 and taking the B Ch degree in 1908 Before the war he had been clinical assistant at the Samaritan Hospital for Women the Evelina Hospital the Victoria Hospital for Children Chelsea and the Hospital for Sick Children Great Ormond Street His father spent much trouble and money in establishing a claim to co-heirship to three peerages which had long been regarded as extinct but died early in 1916 before the Crown had taken action to call them out of abevance In September of that year Gervase Alexander was summoned to the House of Lords as Baron Cobham but having indifferent health and a retiring disposition he took no part in parliamentary business or public life and quitted the practice of medicine for which he had little real inclination

---

The following well known foreign medical men have recently died Professor PETER FOKITSCH director of the Second Surgical Clinic of Tashkent University aged 69 Dr ANTON CHRISTOMANOS professor of experimental pathology at Athens University aged 63 Dr JUVARA an eminent surgeon of Bucarest and Professor LAGOVSKI a Moscow oto-rhino-laryngologist

The Services

LEISHMAN PRIZE

Major H J Bensted M C Royal Army Medical Corps has been awarded the Leishman Prize (Officers) for the year 1932 consisting of a silver medal and a sum of £30 for his work in the interests of military pathology

The Leishman Prize (Officers) is awarded annually for the best piece of work in any branch of medicine surgery or allied sciences or in connexion with the general duties of the Royal Army Medical Corps by an officer of the R A M C or Army Dental Corps or by an officer removed from either of these corps but still on the active list

NORTH PERSIAN FORCES MEMORIAL MEDAL

Dr H J O D Burke-Gaffney Colonial Medical Service has been awarded the North Persian Forces Memorial Medal for the year 1932 for his paper on the classification of the colon aerogenes group of bacteria in relation to their habitat and its application to the sanitary examination of water supplies in the Tropics and in temperate climates published in the *Journal of Hygiene* January 1932

The North Persian Forces Memorial Medal is awarded annually for the best paper on tropical medicine or hygiene published in any journal during the preceding twelve months by a medical officer of under twelve years service of the Royal Navy Royal Army Medical Corps Royal Air Force Indian Medical Service or of the Colonial Medical Service provided the Memorial Committee considers that any of the papers published has attained a standard of merit justifying an award

R A M C COMMISSIONS

An announcement in our advertising pages this week states that twenty five permanent commissions in the Royal Army Medical Corps will be offered on July 27th and application should reach the War Office not later than July 21st Candidates will be elected for commissions without competitive examination and will be required to present themselves in London for interview and medical examination They must be under 28 years of age on August 1st 1933 and registered under the Medical Acts All particulars may be obtained by application in writing or personally to the Assistant Director General Army Medical Services the War Office Whitehall S W 1

Medical Notes in Parliament

[FROM OUR PARLIAMENTARY CORRESPONDENT]

The House of Commons reassembled on June 13th Foreign affairs were debated, and Mr Chamberlain made a brief statement on the British debt to the United States

Slum Clearance and Increased Malnutrition

In the House of Lords after Viscount Gage had moved the second reading of the Rent Restrictions Bill, Lord MARLEY criticized the Government for its 'five year plan for slums' which in his opinion was preposterous nonsense The problem was getting worse, and despite all the promises that had been made and all the ideals which we had in mind, there was no sign that the housing shortage would be met in five years' time If anything it would be worse, and the sufferings of those unfortunate people whose rents would be raised would be largely increased by the Government's action The fact that the position was getting worse was illustrated by the rise in out-relief From August 1931, to April 1933 according to a recent answer given in the House of Commons, the number of persons drawing out relief had gone up from 900 000 to 1 300 000 How could those people pay this rent except at the cost of their food? The medical officer for Deptford had pointed that out He had said that families in receipt of public assistance could not supply themselves with the minimum diet laid down by the Ministry of Health after paying their rent It was a fact and nobody would wish this to continue that malnutrition was increasing among the children of the poorest families The chief medical officer of the Board of Education in the last report he issued, showed that the starvation of children in the poorest families had increased every year for the last five years It was 9 per 1 000 in 1927 9 5 in 1929 and 11 2 in 1931 A recent report of the medical officer of health for Stockton had proved the connexion between high rents and starvation The Stockton Council established a slum clearance scheme built some very fine new houses, and moved a large number of families out of the slums into them The death rate of those families moved out of the slums went up 50 per cent The council was horrified It examined the question very carefully, and the medical officer of health reported that the only explanation was that, whereas the rent in the slums had been 4s a week the rent in the new house was 8s 10d weekly leaving 4s 10d less to be spent on food The BISHOP OF WINCHESTER said that if that had been a debate on the slums he would have endorsed nearly everything Lord Marley had said From time to time attacks were made against the Ecclesiastical Commissioners for owning slum property He had always asked for specific cases, and when they were given he had inquired into them personally So far he had not found any cases of slum property under the complete control of the Commissioners It was true that there was slum property from which they drew ground rents which had been let on very long leases They had no control over that property whatever If they refused to draw the rents it would simply mean that the slum landlord would profit He could assure the House that as soon as property which had been slum property came under the control of the Commissioners they used every effort in their power to turn it into decent property, run on model lines

The Bill was read a second time

Experiments on Animals—Replying to Mr Groves Sir JOHN GILMOUR said there was no information of the number of experiments on animals attended by inspectors in the year 1899, but the figures for the years 1922 1927, and 1931 were 401, 33, and 125 These figures provided no measure of the amount of inspection since it might be a matter of accident whether a number of brief experiments such as inoculations were performed during an inspector's visit Many procedures, such as feeding experiments or experiments involving inoculations or the administration of drugs extended over several weeks and an inspector in the course of his visit saw thousands of animals which were undergoing such experiments There were two inspectors appointed to visit registered places for the purpose of securing compliance with the provisions of the Cruelty to Animals Act

Blind Pensions in Scotland—On June 13th Mr HORE BELISHA informed Mr Burnett that he was unable to state the number of awards and withdrawals of blind pensions made in Scotland for 1929 1930, 1931 and 1932 The numbers of blind pensions in payment in Scotland at December 31st in each of the years 1929 to 1932 and the net increase or decrease over the preceding year were as follows 1929 3 286 (+193), 1930 3,231 (−55), 1931, 3 234 (+3), and 1932 3,165 (−69)

Use of Hyoscine in Asylums—Replying to Mr Groves Sir HILTON YOUNG stated that during last year a commissioner of the Board of Control made a special investigation of the use of sedatives in institutions for the insane in England and Wales, but the results were not yet available For the year 1930 the average number of patients resident in institutions for the insane was 122 614, and the total quantity of hyoscine used was 851 grains The use of croton oil had not been forbidden, but the amount administered during 1930 was negligible

Medical News

The Lord Mayor of London will distribute the prizes at St Thomas's Hospital Medical School in the Governors' Hall, on Tuesday, June 27th, at 3 p m The annual dinner has been fixed for Friday, September 29th at the Dorchester Hotel It will be preceded by a five day post-graduate course at the hospital, old students wishing to attend this course should notify the secretary to the Medical School without delay

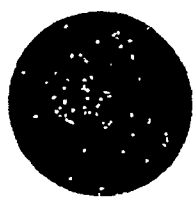
Purest farm milk

ORDINARY RAW MILK often contains more than 15,000,000 germs per cubic centimetre.



CERTIFIED MILK (T.T.) may legally contain up to 30,000 germs per cubic centimetre.

GRADE A may legally contain up to 200,000 germs per cubic centimetre.

made PURER still!

COW & GATE. 200 times purer than the finest certified milk, the highest grade of raw milk.

THE above micro-photographs show that raw milk, no matter how carefully produced, is unfit for a human baby. Cow & Gate, however, take special precautions to ensure that all milk used for their products is subjected to every possible care.

To encourage the farmers in clean methods, each month a Quality Bonus is given, amounting to ½d. to 1d. per gallon extra, to the farmers who produce the purest milk. This may amount to as much as £12 . 10 . 0 extra per month to each farmer.

Special strainers are issued for use immediately after milking, and every churn is examined on arrival. Over 1,000,000 laboratory tests are made in each year at the eight Cow & Gate factories to ensure that nothing but the best is accepted for this *precious purpose—the feeding of babies.* After this the special Cow & Gate process removes any impurities which may still remain, and renders the milk absolutely germ-free and SAFE.

That is why you can be sure of Cow & Gate. Nothing but the best is worthy of the human infant. Prescribe Cow & Gate to-day!

"Cow's milk made safe and suitable for Babies"

The annual general meeting of the Research Defence Society will be held at the London School of Tropical Medicine Keppel Street W C on Thursday June 22nd at 3 p m The chair will be taken by the president Lord Lamington and he will be supported by Sir Arthur Stanley chairman of committee The seventh Stephen Paget Memorial Lecture will be delivered by Sir Leonard Rogers F R S on The Saving in Life and Suffering due to Medical and Veterinary Research with Special Reference to the Tropics Tea will be served after the lecture and visitors are invited

A congress of hydrology will be held at Toulouse in October under the presidency of Professors Sabatier and Abelous The subjects to be discussed are the thermo-mineral waters of the French Pyrenees and their geological grouping the rarer gases of mineral waters climatic cures and pulmonary tuberculosis indications for providing treatment for children in spas mountain resorts and at the seaside primary non suppurative infection of the nervous system in relation to hydro mineral therapy utilization of spas by the French Army and the legal control and survey of mineral waters Sir James Purves Stewart is contributing a report on infections of the nervous system After the congress four days will be devoted to motor car tours in Languedoc Pyrenees and the Cote D Argent Further information may be obtained from Dr François Francon Aix les Bains

The British Red Cross Society's Clinic for Rheumatism and Allied Diseases at 28 Nightingale Place Woolwich has been open since 1930 and in that time 9 376 treatments have been given The average yearly number of patients was 233 The following treatments are to be obtained massage and remedial exercises radiant heat diathermy (including intrapelvic) galvanism faradism sinusoidal Schnee bath and ultra violet rays Pyretic couch treatment when recommended is provided at the Seamen's Hospital Greenwich All patients are seen by a visiting physician (who attends once a fortnight) on the presentation of a letter or card from a general practitioner The Seamen's Hospital has undertaken pathological and bacteriological examinations and Dr Eileen Boyd carried out some research work on the analysis of sweat Radiological examinations have been made either at the Miller General Hospital or the Seamen's Hospital

The Congress of Applied Psychopathology and Psychology which had been arranged to take place in Vienna in the beginning of June has been postponed till next year

The twenty first annual report of the *Journal of the American Medical Association* (May 13th) on the cities of the United States with a population of more than 100 000 of which there were ninety three in 1932 shows that the total typhoid mortality is the lowest ever recorded (1 24 per 100 000 of population) fourteen cities registered entire freedom from typhoid death an unprecedented record

A notice appears in our advertisement columns this week of a vacancy for a medical officer at the Methodist Mission's Leprosy Hospital Dichpali India This institution possesses special facilities for research and is closely associated with the British Empire Leprosy Relief Association Information about the various possibilities of this appointment can be obtained from Sir Leonard Rogers

The King has given authority to Dr R S Miller late Egyptian Government Medical Service to wear the insignia of Commander of the Order of the Nile conferred upon him by H M the King of Egypt on the occasion of his retirement from the service of the Egyptian Government

A David Anderson Berry gold medal together with a sum of money amounting to about £100 will be awarded in July 1935 by the Royal Society of Edinburgh to the person who in the opinion of the council has recently produced the best work on the nature of *x* rays in their therapeutical effect on human diseases A further notice will be published early in 1935 A similar award will be made every three years

Letters, Notes, and Answers

All communications in regard to editorial business should be addressed to **The EDITOR, British Medical Journal B.M.A. House Tavistock Square W.C.1**

QUERIES AND ANSWERS

Myositis Ossificans Progressiva

SIR JAMES BARR writes in reply to the inquiry by Help (June 10th p 1032) These cases follow an injury to the muscles succeeded by too much rest and an inordinate supply of lime in the food and drink Milk and hard water vegetables containing much calcium should be cut out of the diet Lemon quash and barley water raisin tea or glucose with alutaris water nitrogenous food butter and fat bacon cod liver oil should be used decalcifying agents such as acid fruits I have found well-diluted phosphoric acid in small doses useful Moderate doses of iodine and thyroid increase calcium metabolism Gentle massage and infra red rays are beneficial About three years ago I saw a lady who had a large solid lump about the size of my fist involving the heads of the eighth ninth and tenth right ribs She had been seen by some of the best surgeons in London and in Italy the diagnosis was osteosarcoma About one half of the surgeons were for removal and the other half to leave it alone I said that the diagnosis and proposed lines of treatment by both sets of surgeons were wrong It was not a sarcoma but a simple case of myositis ossificans or a deposit of calcium salts in injured muscle and fibrous tissue brought about by injury of the spine and ribs when horse riding and afterwards using hard London and French waters Any attempt at removal would involve a fearful mess including removal of the heads of about four ribs and final cure could only be effected by a further deposit of lime salts On the other hand it must not be left alone but a cure attempted by the removal of the lime salts on the lines sketched out above Many of the cases which we see described in the *B M J* require a little common sense—the rarest of all our senses I advised her husband to take her to see Sir Robert Jones but he need not mention my name until he got Jones's opinion He replied Supposing Sir Robert says Operate will you change your opinion I replied Not in the slightest particular but I have too high an opinion of Jones to think that he would be such a fool Jones did not alter my treatment and I believe the patient is progressing favourably

DR WILLIAM F MUIR (St. Andrews) writes If your correspondent Help could have access to the *Edinburgh Medical Journal* of January and February 1932 he would find the subject very fully dealt with in a monograph contributed from the James Mackenzie Institute for Clinical Research St Andrews and the history of two cases similar to his own It is impossible to give the information he requires in a brief note

Pruritus in Tabes

J E writes in reply to the query by Bridgeness (May 20th p 903) I would refer your correspondent to the article by A Winkelried Williams in the *British Medical Journal* of January 24th 1925— Cure of Pruritus Senilis by the Use of a Flesh Brush I had occasion to recom-

NEMBUTAL

(ABBOTT)

IN Nembutal, the Abbott Laboratories research staff offers a barbiturate having a short but powerful hypnotic and a prolonged sedative action from small dosage, as well as other desirable qualities for a pre-anaesthetic sedative.

Administered orally, Nembutal (Abbott) allays pre-operative fear and apprehension; reduces the quantity of inhalation or other anaesthetic usually required; and tends to prevent subsequent undue reactions.

This Abbott research product is used to advantage as a sedative and hypnotic not only pre-operatively in major surgery, but also in minor surgery, dentistry, obstetrics, and in general practice. It is also available for intravenous injection as a total anaesthetic.

Nembutal (Abbott) is supplied in capsules of 1½ grains for oral administration. It is available, on prescription only, through your usual chemist.

"IODOLYSIN"

(TRADE MARK)

A Powerful Fibrolytic Agent

Gives strikingly successful results in many cases of rheumatoid arthritis and allied arthropathies.

Also employed with advantage for the removal of all other forms of pathological fibrous tissue.

It is a chemical combination of Iodine and Thiosinamin with these special features:

READY SOLUBILITY IN WATER. WELL TOLERATED. ABSENCE OF LOCAL REACTION ON INJECTION.

"Iodolysin" is supplied in ampoules for hypodermic injection; in capsules for oral administration, or as an ointment or paint for local application.

Free Clinical Sample and Literature on request.

ALLEN & HANBURYS LTD., LONDON, E.2

Telephone: 3201 Bishopsgate (10 lines). Telegrams: "Greenbury3, Beth, London."

mend the treatment once to an old man suffering from fibroid phthisis whose life was rendered miserable by incessant generalized pruritus without apparent cause The brush gave immediate complete relief

Income Tax

House Provided by Employer

'DOUBTFUL" has been employed as a whole time medical officer to an institution since January 1st 1916 and has been required by the institution to live in a house provided by them rent and rates free' Subsequent to March 30th 1933 a better house has been provided—as a result of some pressure by 'Doubtful'—but the requirement to reside in the house still applies Is "Doubtful" liable to account for tax on the annual value of the house?

*** Prima facie the case is covered by the old rule laid down in Tennant *v* Smith and Doubtful' need not regard the annual value (nor the amount of the rates paid on the house) as income liable to tax in his hands If in the past he has included the sum in his return and paid tax thereon under Schedule E he can claim repayment for the past six years There is however the possibility that the tax paid has been only that assessed under Schedule A in respect of the residential value of property owned and (technically) occupied' by a charitable body in that case no repayment would be due as the charitable exemption to which the institution may be entitled would not apply to the residence of an official liable to income tax

Cost of Uniform Instruments etc

'SHIP SURGEON asks whether there is a definite sum (?£20 a year) allowed for upkeep of uniform even though a uniform is bought for each year Also can he claim a rebate for expenditure on medical instruments and subscriptions to the B M A, etc

*** We understand that there is a standard uniform allowance applicable to ship surgeons—£20 per annum is probably correct—and that it is allowed each year on the assumption that if excessive for one particular year it is reasonable in the long run (It is presumed that the employing company do not bear any part of the expense) The cost of *replacing* instruments etc, and of membership of medical societies is allowable if the upkeep and membership respectively is required by the employer

LETTERS, NOTES, ETC

Medical Films

Kodak Limited are to be congratulated on the large range of subjects offered in their motion picture library the catalogue of which we have received A new system of indexing by subject and alphabetical groups makes the choice of film easy and no one will quarrel with the wealth of material available which by no means exhausts the possibilities of important future developments Films are offered for both sale and hire, and charges have been reduced The simplified technique of 'cine Kodak" photography now makes it possible for medical men to take their own pictures while the introduction of the super sensitive panchromatic film is an advance of great importance Details may be obtained from the medical department Kodak Limited, Kingsway W C 2

We have also received from the Central Information Bureau for Educational Films, 109 Kingsway W C 2 a catalogue of instructional films which include medical subjects Many of these deal with hygiene from the popular angle but there are also pictures on physiology, psychology, and anthropology

Dr Mary E Walker

Mrs C W M POYNTER (1306 South 35th Avenue Omaha Nebraska U S A) writes At the suggestion of the editor of *Notes and Queries* I am writing to the editors of a few publications in England asking for help in acquiring some biographical material In 1866, when England had but one female physician and was not very anxious to have more Dr Mary E Walker of Oswego New York visited England and created much comment in newspapers and journals of various types including your own She went in time to attend the Social Science Congress in Manchester early in October She visited hospitals and clinics made the acquaintance of many people of all classes apparently lectured in the Great St James's Hall was presented at Court and became known far and wide for her peculiar costume her medical degree and her civil war career There must be a number of people in England and Scotland with perhaps family traditions about her and possibly with letters or newspaper cuttings which I might borrow for a short time I should like to get into communication with anyone who might give me information about Dr Walker during her sojourn in England

The Naive and Sardonic Eye

Dr CLAUDE LILLINGSTON writes from Paris In a singularly charming review of Dr Halliday Sutherland's book *The Arches of the Years* in the *Journal* for June 3rd (p 965) your reviewer credits the author with a naive and sardonic eye We have all met the naive eye though not of course, in Scotsmen The sardonic eye is also quite familiar But is not the eye which simultaneously exhibits *naïveté* and sardonic properties a startlingly novel conception a new clinical syndrome a new psychological or nosological entity? On my first reading I was tempted to wonder if your reviewer had not blundered into a contradiction in terms but on mature reflection I ask myself if he had not rather revealed a profound perspicuity, an intuitive insight into character denied to most mortals If so the day may come when the psychologically trained medical student will be taught how to detect X's (your reviewer's name) eye and how to distinguish it from the possessor of an Argyll Robertson pupil etc Meanwhile is it not up to your reviewer to publish a treatise on his discovery with documentary, cinematographic evidence to substantiate it?

Birth at 20 m p h

"C R H writes from India A short time ago, while on an inspection tour, there came to my notice a birth, with medical factors not uncommon but with related circumstances sufficiently unique that I imagine they will bear record The third-class compartment of the Indian train—'females" utilize such not women or ladies—duly caters for the squatting posture commonly adopted for defaecation in India So we find a small closet with two foot stands and a hole in the floor which in the case in question was directly over one of the rails A female full of belly entered such a closet in Naraynpur station the train moved off and at a time when it was judged the train was travelling at some 20 m p h, a yell was heard to emanate from the lavatory This was forcibly entered by other travellers who found the female lying in a mess of blood and minus her abdominal protuberance Labour had been precipitate but there was no sign of the child The woman was removed from the train at the next station Meanwhile the permanent way inspector and his staff had discovered a newborn child on the line without as much as a bruise and this despite the fact that the child must have fallen on to the rail some foot and a half in front of one of the wheels and then bounced on to the metal The cord had been cut and ligatured (!) by the wheel of the carriage Mother and child were reunited in Naraynpur Hospital and both are very fit—so much so that the mother ran away the same night carrying the child in her arms A touch of humour was added to the case by the permanent way inspector, who concluded his report in the approved official manner 'No damage to the permanent way"

Dermatitis after Depilatories

Dr A KENDREW (Ticehurst Sussex) writes I am surprised to read in Dr Alice Carleton's article on 'The Uses and Dangers of Cosmetics" appearing in your issue of June 10th that she considers depilatories "generally harmless' In the past three years I have seen two patients *suffering* from axillary adenitis after using them one of these cases was reported in the *British Medical Journal* during 1930 and shortly afterwards a case was published by a correspondent from another part of England

Dr ALICE CARLETON writes My article in your last number on "The Uses and Dangers of Cosmetics" has been widely commented on in the daily press May I say that this publicity was unexpected and undesired by me?

Honours List Correction

In the Honours List published in our issue of June 10th (p 1020) Dr Patricia R Elliott and Dr Frederic G Rose should have been described as recipients of the M B E

We are asked to correct a misprint in the advertisement of the Victor X Ray Corporation Ltd, published on May 27th (p 6) The address should have read 15–19, Cavendish Place London W 1

Vacancies

Notifications of offices vacant in universities medical colleges and of vacant resident and other appointments at hospitals will be found at pages 52, 58 54 55 56 57 and 60 of our advertisement columns and advertisements as to partnerships assistantships and locumtenencies at pages 58 and 59

A short summary of vacant posts notified in the advertisement columns appears in the *Supplement* at page 276

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine

422 X Ray Study of Gastro-Intestinal Food Allergy

A H ROWE (*Journ Amer Med Assoc* Feb 11th 1933 p 394) who considers that food allergy is the cause of certain disturbances in the muscular tone and peristaltic activity of the gastro-intestinal tract bases his conclusions on *x* ray observations Since mucous membrane oedema and smooth muscle spasm are the main results of allergy gastro-intestinal symptoms might be expected Four patients are here selected for report They had all suffered from marked and prolonged gastric symptoms which had been relieved by the elimination of specific foods and reproduced by the reintroduction of the same foods Fluoroscopic examinations and roentgenograms were made immediately after the ingestion of barium and again three six and twenty four hours afterwards Such studies were first made when the patients had been free from their symptoms for several weeks as a result of their strict adherence to their elimination diets The barium was given in a corn meal gruel About two to three weeks later a second series of observations was made after the patients had taken milk or milk and eggs for one or two days The barium was given in malted milk to which each patient was sensitive Marked disturbances in muscular tone and motility resulting from probable allergic reactions in the gastro-intestinal tissues were observed in each of the four patients Gastric retention was also seen in each case this was marked in three hours and very definite in six hours This retention might the author adds be explained by some disturbance in peristalsis which interfered with the gastric or intestinal gradient Such disturbance could be the result of localized or generalized oedema or smooth muscle spasm arising from allergic reactions to milk and eggs Spastic colons were observed in three cases and were also thought to be caused by an allergic reaction of the smooth muscle Long standing constipation was relieved in two cases by 'elimination' diets only to return when milk and eggs were again taken That the gastric retention and spastic colons were not due to impaired digestion or to nervousness was shown by the fact that routine indigestion treatment had been previously followed without success and all four cases had already been submitted to *x* ray examinations

423 Hypoglycaemia

O SIPPE and J BOSTOCK (*Med Journ of Australia* February 18th 1933 p 207) believe that hypoglycaemia is a relatively common condition—nearly as frequent as hyperglycaemia—and that it deserves more careful consideration than it has yet received They report twenty five original cases and suggest a classification They suggest that in the study of this condition it is very important to perform a glucose tolerance test in preference to a single fasting sugar test This is based on the assumption that the nervous mechanism associated with the performance of the latter test results in a secretion of adrenaline which mobilizes glycogen and raises the sugar figure above its normal height In the presence of typical symptoms of this condition any fall of the blood sugar below 0 09 per cent is to be regarded with suspicion even though it is known that there may be a complete absence of symptoms associated with a much lower percentage The question of idiosyncrasy is thus important Among the causes of hypoglycaemia are mentioned congenital predisposition (including a family history of acidosis cyclical vomiting or migraine) lack of exercise a hot climate and a high consumption of protein The authors believe that the condition is more common in Australia than in some other parts of the world and attribute this higher incidence to the generally large consumption of meat in that country and to the reduction of exercise during the summer Six aetiological factors are enumerated—namely the pancreas (hyperinsulinism) low intake poor assimilation or excessive use of carbohydrates liver and muscular dystrophies endocrine derangement particularly parathyroid disturbance resulting in hypocalcaemia lowering of the renal threshold for sugar often due to hypocalcaemia and certain allergic states As regards classification the authors suggest a division into two main types *true* and *relative* hypoglycaemia The first contains three groups the fulminating the chronic and the symptomless The second comprises two groups the cyclical vomiting of childhood and simple cases in which a relatively normal blood supply is insufficient for the requirements of the individual They urge recognition of the cause and attention to such possible factors as endocrine maladjustment and focal sepsis The administration of glucose is often very effective but in cases of acidosis it is necessary to restrict fats especially butter and to allow eggs in only very small numbers Hypoglycaemia it is concluded with its attendant train of symptoms is to be regarded as a metabolic disturbance due to many causes comparable with pyrexia and at times preferably dealt with directly rather than indirectly There seems to be some natural mechanism promoting spontaneous recovery from an acute attack possibly the stimulation by the low blood sugar content of some nervous or endocrine centre which mobilizes a supply of glycogen

Surgery

424 Henderson Jones Disease

J L NAVA (*Thèse de Paris* 1933 No 95) who records thirteen illustrative cases in patients aged from 20 to 65 ten of whom were men and three women states that the osteo-chondromatosis described by Henderson and Jones of the Mayo Clinic in 1916 is characterized by the presence usually in large number of fibroid or osteo-cartilaginous foreign bodies in a joint cavity or in the bursa of a tendon sheath The affection is commonest in young adults usually of the male sex without any previous infection or intoxication though in about half the cases there is a history of old or recent trauma The presence of the foreign bodies usually causes little interference with the movement of the joint but may give rise to attacks of articular block and finally symptoms of compression of the vessels or nerves In well marked cases *x* ray examination is sufficient to distinguish the disease from all other arthropathies In mild cases radiotherapy alone is needed but when a large number of foreign bodies are present and especially in complicated cases radiotherapy should be preceded by a conservative arthrotomy

425 Acetylcholine in Post traumatic Ankylosis and Arthritis

As a prophylactic against and a curative of the rigidity or ankylosis pain and osteoporosis that are frequent sequels of articular fracture (especially of the knee ankle shoulder and wrist) or of a prolonged immobilization of a limb R FISCHER (*Presse Méd* March 25th 1933 p 475) advocates the administration of acetylcholine A disturbance of the sympathetic system is a predominant factor in the pathogenesis of these symptoms Fischer considers that circulatory troubles are also essential agents Acetylcholine hydrochlorate is a well known vaso-dilator of the small peripheral and possibly of all the arteries it is indicated in conditions of arterial spasticity such as Raynaud's disease etc and has been beneficially used by Dainow and Fischer himself in varicose ulcers These facts led the latter to employ it in cases of post traumatic fractures To exemplify the excellent results following its administration thirteen cases are recorded in five it was used curatively and in eight prophylactically A course of treatment consists in fifteen to twenty injections each containing 0 1 c cm an injection is given every one or two

The **SPECIFIC OVARIAN HORMONE**

which normally controls and activates the menstrual cycle

SISTOMENSIN

standardised physiologically

dysmenorrhœa, menorrhagia, hæmorrhages of puberty and menopause, hypoplasia of the uterus, disturbances subsequent to menopause or oöphorectomy.

Tablets Ampoules

PROKLIMAN

(Sistomensin Compound)

Association of ovarian hormone with therapeutic agents for the prompt relief of the most pronounced troubles of menopause: cardiovascular and nervous troubles, hot flushes, headache, etc.

Tablets

Hydrosoluble Ovarian Substance

No entrance fee to those joining within 12 months of registration. Assets exceed £50,000.

Full particulars and application form from the Secretary, Victory House, Leicester Square, W.C.2. Gerrard 4814.

days, the dose may be increased during the first days of immobilization This treatment should be started early after immobilization, and continued as the condition of the joint demands Little is known concerning the mechanism of the action of acetylcholine It is probable that the traumatized area presents a vaso-constriction of the secondary arteries, and the good results from its injection are due to the vaso-dilating action of the drug This action of acetylcholine is dependent on the calcium-potassium ratio and the salt appears to have a marked and continued effect on calcium metabolism and the alkalinity of the blood Its combined vaso-dilating action and favourable effect on the calcium metabolism cause the good results These are similar to those obtained by sympathectomy The advantages of acetylcholine over the latter are not only its simpler administration, but also its effect on the osteoporosis After sympathectomy this condition becomes more marked, after acetylcholine it is much improved

426 Embolectomy from Popliteal Artery

I BOEREMA (*Nederl Tijdschr v Geneesk*, March 25th, 1933, p 1281), who records an illustrative case, states that diagnosis of embolism in a limb can usually be made by the sudden onset of very severe pain, pallor of the part, and rapid disappearance of sensation and of the pulse Raynaud's disease can be excluded by its slower onset and bilateral localization, and intermittent claudication by its prodromal symptoms Most of the patients are subjects of heart disease (60 per cent according to Petitpierre) Embolism may also occur after gynaecological operations, as is shown by the fact that Stein collected eighty-six cases of the kind The prognosis of embolectomy is very good within the first ten hours of the occurrence of the embolism Boerema's patient was a woman aged 60 the subject of heart disease (myocardial degeneration and flutter), who suddenly developed typical signs of right popliteal embolism Embolectomy was performed under local anaesthesia Apart from slight gangrene of the terminal phalanges of the second and third toes, complete recovery took place

427 "Fracture Serum" in Pseudarthroses

R IMBERT (*Bull et Mém Soc Nat de Chir*, March 18th, 1933, p 406) discusses the treatment of pseudarthroses and delayed union by "fracture serum" Three cases are reported which made astonishing recoveries after the injection of this substance The serum is taken from a patient who has a healthy healing fracture showing good consolidation, or from one with a recent fracture The serum is given in doses of 10 to 15 c cm, and repeated, if necessary, at varying intervals The injections may be local, hypodermic, or intravenous In one case of fractured femur in a man aged 30 the leg was first immobilized in a Thomas splint and later in plaster After removal of the second plaster, nearly five months after the accident, there was no sign of consolidation Since abnormal mobility persisted with complete absence of pain on pressure over the lesion, and absolute loss of function, it was concluded that a pseudarthrosis existed No specific cause could be assigned to this The Bordet-Wassermann reaction of the blood was negative From another patient whose fracture was consolidating well, 20 grams of blood were taken and prepared Ten c cm of the serum was injected near the site of the pseudarthrosis Six weeks later there was less mobility and the radiograph showed a shadow of new calcification round the broken ends of bone A further injection of 10 c cm "fracture serum" was provided by another patient Manifest callus was seen in a radiograph two and a half months after the first injection A third injection produced a thickening of the callus and also increased its density The final result was complete consolidation, and the patient was discharged without any support Two other cases reported were treated by subcutaneous injections of "fracture serum" Discussing the mechanism of this retarded osteogenesis, Imbert suggests that there may be an absence of an element—possibly a glandular hormone—which is necessary to fix the free calcium at the site of the fracture

Therapeutics

428 A Stable Ferrous Chloride Syrup

G H W LUCAS and V E HENDERSON (*Canadian Med Assoc Journ*, March, 1933, p 298) recall the fact that the success of iron therapy depends on the adequate supply of ferrous salts to the upper part of the large intestine, where they are absorbed When ferric salts such as the chloride, are administered in conjunction with food, the iron is precipitated in the stomach by the protein, and is reduced in some small measure to the ferrous state, which does not act on proteins When reduced iron is given as such, a portion of it is acted on by the gastric hydrochloric acid, and the resulting small amounts of ferrous chloride pass on into the large intestine, where they are absorbed Even large doses of iron and ammonium citrate are inactive until some of this salt has been modified by the free gastric hydrochloric acid, and the free ferric ions resulting have been reduced by the food Since ferrous chloride is the most easily absorbed iron salt, its administration is indicated, some investigators have shown that 1 5 grains of a ferrous salt are capable of producing as good clinical results as are derivable from much larger doses of iron in other forms The difficulty lies in obtaining a ferrous chloride preparation in a suitable state for administration, owing to the ease with which it becomes oxidized Good clinical results have been obtained by the present authors with a syrup prepared by reducing a solution of iron perchloride with an excess of reduced iron and testing the liquid for its content of soluble ferrous iron with potassium permanganate after acidification with hydrochloric acid to stabilize it The liquid was then diluted with syrup so that one fluid drachm contained approximately 0 5 grain of iron in the form of ferrous chloride This dose of syrup, diluted to about one ounce with water, was given three times daily after meals, its small content of free hydrochloric acid possibly aided digestion A simpler method of preparation was then devised, the ingredients being reduced iron (24 grains), dilute hydrochloric acid (1 ounce), and syrup to 6 ounces The reduced iron and acid are placed in a bottle and allowed to stand loosely stoppered until effervescence has ceased and all the iron has disappeared Warming the contents greatly hastens the reaction The solution is then filtered, if necessary, and the bottle is filled with simple syrup This preparation will keep for about a month under ordinary conditions if protected from sunlight It may become a very pale yellow, but only a trace of ferric salt is present When stored in brown bottles in a cool place it will keep much longer Each drachm dose contains approximately half a grain of iron in the form of ferrous chloride, and about 2 to 3 minims of acid

429 Formic Acid in Rheumatic Affections

H TOLDERLUND (*Ugeskrift for Laeger*, March 16th, 1933 p 305) has treated threescore patients during the past six years with intramuscular injections of formic acid for their rheumatic complaints In most cases these were myalgias with tender subcutaneous and muscular infiltrations His material also contained some cases of sciatica articular rheumatism, and neuralgia The treatment was almost invariably ambulant, and the results were, as a rule, not compromised by any other therapeutic measure Some failures had to be recorded but as a rule definite improvement was demonstrable after six or seven injections, sometimes earlier The muscles chosen for the injections were those of the buttocks and thighs, subcutaneous injections were dispensed with on account of the pain they are apt to provoke Intramuscular injections may also at times be painful, but even bad pain passes off quickly Occasionally the seat of the rheumatic ailments, whether it were muscle or joint was particularly painful on the day of an injection, but this could hardly be regarded as a focal reaction The Danish preparation used by the author was sol acidi formici (Leo) 2 c cm of which he injected at a time He gives no further information as to dosage, but he appends details of eight illustrative cases

Radiology

430 Roentgenotherapy in Arthritis

H LANGER (*Radiology* February 1933 p 78) describes the effects of short wave *x* ray therapy on the vegetative nervous system in arthritic patients as at first exacerbation of symptoms followed by a definite amelioration Cases showing symmetrical arthritic disturbances were treated with *x* rays either over the corresponding sympathetic ganglia alone or in addition to the direct radiological treatment of the affected joints The ganglia were treated with the following technique 185 to 200 kV rays filtered through 0 5 mm of copper and 3 mm of aluminium field 8 × 18 cm over the corresponding lumbar or cervical ganglia 200 *r* units per sitting and per field daily treatments until 500 *r* per field have been reached A similar technique was used for the local treatments of the affected joints In sixty three out of eighty-six cases of arthritis showing disturbances of the vegetative nervous system the effect of the *x* ray treatment of the ganglia was so marked that no local treatment was deemed necessary The treatment had to be repeated in some cases after from six to eight weeks The author strongly urges co operation with the referring physician for the supervision of the reaction following the *x* ray treatment

431 The Action of X Rays on Blood forming Cells

R ISAACS (*Arch Int Med* December 1932 p 836) has studied the problem underlying the opinion that small doses of *x* rays stimulate while large doses depress After the therapeutic use of large doses death or a decrease in size of the tissues affected follows It has been debated whether this result is due to direct toxic necrosis of the tissues or to a mechanism disturbing cell division or to an increase in the rate and intensity of the normal processes in the life of the cell More than 900 patients with various types of leukaemia lymphoblastoma or cancer were investigated Isaacs reports that the effect of *x* ray application whether in small or large doses is stimulating the result depending on the stage of development of the cells Cells in the myeloblastic lymphoblastic or younger stages are stimulated to rapid reproduction because this is their growth potentiality at these stages whereas cells in the myelocytic or the medium-sized lymphocytic stage are stimulated to grow through the rest of their life history in an orderly manner because these cells do not normally divide or multiply They die or are eliminated as normal senile cells The author could obtain no evidence of any toxic necrotic action of *x*-rays when applied in therapeutic doses The process of stimulation is however hastened by the larger doses so that senility is reached more quickly giving the impression of some depressant action The period between exposure to *x* rays and the time when the cells reach senility is indicated by the clinical latent period Tissue cells which have a long adult life (muscle nerve and fibrous tissue cells) appear resistant to *x* rays whereas those cells which have a short adult life (germinal cells and leucocytes) die soon after having been stimulated to progress to senility All cells adds Isaacs have the same susceptibility but death follows at varying intervals depending on how long the cells normally survive in their physiological life

432 Radiological Diagnosis of Biliary Lithiasis

Besides those cases of biliary lithiasis in which *x* ray examination reveals the presence of calculi others occur with no pathological sign in the gall bladder In these by the use of Graham's method this organ becomes opaque and clear images appear in the field these may be due to calculi to superimposition of the gall bladder on an ectocolia of the right angle or very rarely to papillomata Non filling of the gall bladder with the lipiodol usually indicates (except in cases of hepatic insufficiency) vesicular trouble most frequently lithiasis R GILBERT (*Journ de Radiol et d Electrol* January 1933 p 43) records a case in which clear images were shown In this patient who suffered from digestive troubles and right abdominal pains previous diagnosis of appendicitis and visceral and renal ptosis had been erroneously made despite the use of *x* rays treatment producing no results attention was directed to the gall bladder Examination by Graham's method revealed two small calculi the diagnosis was confirmed by functional tests and a subsequent operation The author remarks that clear images are generally seen in gall bladders with well-conserved walls and containing one or only a few calculi These bladders fill easily with iodized bile and respond well to the action of cholecystokinetics such as fatty food and yolk of eggs Gilbert maintains that in all poorly characterized affections of the right upper abdomen exploration of the gall bladder by Graham's method is after clinical investigation a necessary complement of radiological examination of the digestive tube J ARMAND (*ibid* p 41) records a case in which an abnormal shadow at the lower border of the liver had been in error diagnosed as biliary lithiasis At the operation a normal gall bladder was found and microscopical examination of an excised piece of the liver showed a sclerosed calcareous tuberculous tissue As measures to obviate such diagnostic mistakes Armand recommends cholecystography and stereoradiography

Obstetrics and Gynaecology

433 Puerperal General Peritonitis

L V PYRAH and C OLDFIELD (*Journ Obstet and Gynaecol British Empire* February 1933 p 3) review all the cases of general puerperal peritonitis occurring in the years 1926 and 1931 inclusive in the Leeds General Infirmary the Seacroft Fever Hospital and elsewhere the total being thirty-six Of these patients twenty five died and eleven recovered They find that this complication is present in about half of all patients who die from puerperal fever and in most cases is the immediate cause of death The streptococcus is the organism most frequently identified and has been assumed to be almost invariably fatal The most severe cases are those in which peritoneal inflammation begins within the first three or four days after delivery following the rapid invasion of the cavity by organisms which enter through the lymphatic vessels in the wall of the uterus There is very often a blood infection but rarely any localized pelvic suppuration The mortality rate is very high Cases occurring four days or more after delivery are less severe Localized pelvic suppuration is often found in these more commonly in the wall of the uterus and much less frequently in the ovary and broad ligament The peritoneal infection may originate in the uterus but arises more commonly from the local abscess Other causes of this infection noted are Caesarean section gross trauma acute appendicitis perforated duodenal ulcer pneumococcal infection and the infection or torsion of pre-existing pelvic tumours The symptomatology varies widely In early cases there is first a rise in temperature with a considerable increase in the pulse rate The onset of peritonitis is signalized by a gradual and insidious change for the worse in the general condition and by abdominal discomfort There may be a rigor and after the succeeding fall the temperature rises and remains elevated The pulse is persistently rapid and its tension weakens The abdominal symptoms may be very slight but there is usually some discomfort vaguely referred to the umbilical region The first physical sign always present is distension of the lower part of the abdomen In the early stages however it may be disproportionate only with difficulty from persistent flatulence This distension gradually increases until the abdomen becomes drum like on percussion as well as tender abdominal tenderness and hyperaesthesia are usually present Rigidity is generally absent In delayed cases the onset of puerperal peritonitis is signalized by a rigor abdominal pain and greatly increased pulse rate The authors urge that when puerperal peritonitis is suspected an operation should be undertaken much more often than has been the practice hitherto and without waiting for the development of the complete clinical picture Cases of puerperal

MEDICINE—Essentials for Practitioners and Students

By G. E. BEAUMONT, D.M., F.R.C.P., Physician, with Charge of Out-patients, Middlesex Hospital.

"... a valuable and complete text-book ... the popularity of such a volume can be assured ... there can scarcely be a better guinea's worth."—BRITISH MEDICAL JOURNAL.

THE SCIENCE AND PRACTICE OF SURGERY
By W. H. C. ROMANIS, F.R.C.S., and PHILIP H. MITCHINER, F.R.C.S. 4th Ed. 752 Illus. 2 Vols. 28s.

HALE-WHITE'S MATERIA MEDICA
21st Ed. Based on the new B.P. Revised by A. H. DOUTHWAITE, M.D., F.R.C.P. 10s. 6d.

A TEXT-BOOK OF SURGICAL PATHOLOGY
By C. F. W. ILLINGWORTH, F.R.C.S.; and B. M. DICK, F.R.C.S. 290 Illus. 36s.

THE BIOCHEMISTRY OF MEDICINE
By A. T. CAMERON, D.Sc., F.I.C., and C. R. GILMOUR, M.D., C.M. 31 Illus. 21s.

TAYLOR'S PRACTICE OF MEDICINE
By E. P. POULTON, M.D., F.R.C.P. With the assistance of C. PUTNAM SYMONDS, M.D.; H. W. BARBER, M.B., F.R.C.P.; and R. D. GILLESPIE, M.D. 14th Ed. 64 Plates, 12 Coloured. 103 Text-figures. 25s.

DISEASES OF THE EYE
By Sir J. H. PARSONS, C.B.E., F.R.S. 6th Ed. 21 Plates, 20 in Colour. 348 Text-figures. 18s.

A MANUAL OF MIDWIFERY
By T. W. EDEN, M.D., F.R.C.S., and EARDLEY HOLLAND, M.D., F.R.C.S. 7th Ed. 9 Plates (5 Coloured) and 389 Text-figures. 21s.

QUEEN CHARLOTTE'S PRACTICE OF OBSTETRICS
By Members of the Staff of the Hospital. 2nd Ed. 4 Coloured Plates and 274 Text-figures. 18s.

FORENSIC MEDICINE
By SYDNEY SMITH, M.D., D.P.H. 3rd Ed. 170 Illus. 24s.

THRESH & BEALE'S EXAMINATION OF WATERS AND WATER SUPPLIES
4th Ed. Revised by J. F. BEALE, D.P.H., and E. V. SUCKLING, M.B., D.P.H. 61 Illus. 42s.

FAVOURITE PRESCRIPTIONS
By ESPINE WARD, M.D. 3rd Ed. 7s. 6d.

DISEASES OF THE SKIN
By J. H. SEQUEIRA, M.D., F.R.C.P., F.R.C.S. 4th Ed. 56 Coloured Plates and 309 Text-figures. 42s.

STARLING'S PRINCIPLES OF HUMAN PHYSIOLOGY
Edited and Revised by C. LOVATT EVANS, F.R.S. 5th Ed. 543 Illus., 9 in Colour. 21s.

THE OPERATIONS OF SURGERY
By R. P. ROWLANDS, O.B.E., M.S., F.R.C.S., and PHILIP TURNER, M.S., F.R.C.S. 7th Ed. 900 Illus., 45 in Colour. 2 Vols. 70s.

London: J. & A. CHURCHILL, 40 Gloucester Place, Portman Square, W.1

JUST PUBLISHED. TENTH EDITION. Fully Revised. Crown 8vo. 700 pages. With 179 Illustrations and Coloured Diagrams of Surface Markings. 17s. 6d. net; postage 9d.

SYNOPSIS OF SURGERY

By ERNEST W. HEY GROVES, M.S., M.D., B.Sc.(Lond.), F.R.C.S.(Eng.),
Emeritus Professor of Surgery, Univ. of Bristol; Consulting Surgeon, Bristol General Hospital.

"May be regarded as complete in its range of subjects ... among the best of its kind."—BRITISH MEDICAL JOURNAL.
"This synopsis of surgery has had a wide sale, which has necessitated the issue of frequent editions, and it deserves thoroughly all the success it has attained."—LANCET.

NEARLY READY. FOURTH EDITION. Fully Revised. Large 8vo. 304 pages. With 335 Illustrations, some of which are in Colour. 21s. net; postage 9d.

DEMONSTRATIONS OF PHYSICAL SIGNS IN CLINICAL SURGERY

By HAMILTON BAILEY, F.R.C.S.(Eng.),
Surgeon, Royal Northern Hospital and Battersea General Hospital, London; Cons. Surgeon, Essex County Council

"An admirable book which we can recommend to all students"—BRITISH JOURNAL OF SURGERY.
"We have nothing but praise for this book, which should be in the hands of every student."—EDINBURGH MEDICAL JOURNAL.

Bristol: JOHN WRIGHT & SONS LTD. [Illustrated Catalogue free.] London: SIMPKIN MARSHALL LTD.

DISEASES OF THE HEART

Described for Practitioners and Students

By SIR THOMAS LEWIS,
C.B.E., F.R.S., M.D., D.Sc., LL.D., F.R.C.P.
Physician in Charge of Department of Clinical Research, University College Hospital, London; Physician of the Staff of the Medical Research Council. 12s. 6d. net.

"To say that this is the best book on heart diseases ever written in English is not to overstate the truth regarding this literary effort of its distinguished author."—*Medical Times.*

sepsis in which a palpable mass is present must be very carefully watched for signs of involvement of the general peritoneal cavity Should these appear an immediate operation is essential Abscess of the uterine wall is especially liable to become associated with general peritonitis

434 Treatment of Puerperal Infection

E LÉVY SOLAL (*Presse Méd*, March 15th, 1933, p 419) outlines the treatment of puerperal infection in cases of unknown origin presenting the usual symptoms of infection (rise of temperature, rapid pulse, rigors) during the first days following delivery Successful treatment entails a correct differential diagnosis and a careful study as to whether the infection is still confined to the uterus or is extending The chief condition to be differentiated is coli bacilluria, a frequent sequel of confinement blood culture on the appearance of fever or rigors and repeated during the following few days is of value in determining the second point Treatment should be both local and general The former consists in dressings of anti-streptococcic filtrate (Besredka) The good results ensuing from this method in numerous cases during the past six years are summarized This treatment should be prophylactic or applied very early before the sixth day of infection, the filtrates should be prepared from cultures obtained from highly infected cases, and the dressings should cover the whole uterine surface, not merely the cervico segmental cavity In preference to the usual methods of general treatment Lévy-Solal now employs simple blood transfusions, immuno transfusions (phylacto transfusions), or convalescent serums The first-named may be given in certain subacute cases and in cases with negative blood cultures but with a rapidly progressive anaemia The best results are obtained with convalescent serums, but, owing to the difficulty in securing suitable donors, phylacto transfusion is usually employed For this the donors are prepared by injections of anti-streptococcic vaccines in doses of 1 c cm the first day and 2 c cm on each of the three succeeding days—that is a total of 7 c cm containing 7 milliards of streptococci, they are revaccinated six hours before the transfusion is given Phylacto-transfusion should be immediately performed in cases with positive blood cultures, and in negative cases giving negative intradermal reactions For the abortive treatment of perigenital infections and phlebitis Levy-Solal advocates pelvic infiltrations with Delbet's vaccine rather than subcutaneous injections, 1 c cm of the vaccine or of a 5 per cent solution of sodium nucleinate should be symmetrically injected intracervically

435 Effect of "Granulosa Cell" Tumours on the Uterus

A LELLBACH (*Zentralbl f Gynak*, March 31st, 1933, p 725) refers to the excessive glandular hypertrophy of the uterine mucosa that is found frequently in association with ovarian tumours of different types After the menopause ovarian tumours may induce hypertrophy of the uterine wall in addition to that of the uterine mucosa The majority of such tumours are of the 'granulosa cell' type R Meyer has suggested that this hypertrophy is a substitute for ordinary follicular stimulation He has not found any evidence of the occurrence of fibromata and sarcomata in association with mucous glandular hyperplasia Lellbach records a case of ovarian tumour associated with excessive uterine mucous and muscular hypertrophy A married woman, aged 60 years was admitted with the diagnosis of uterine myoma and ovarian tumour The menopause occurred when she was 45 Fifteen months before admission she noticed slight irregular haemorrhages Nine months later she observed an abdominal swelling accompanied by frequent haemorrhages The uterus and right adnexa were removed She was discharged cured sixteen days later The uterus was pear-shaped, measuring 6½ by 5 inches it was very hard and greyish yellow on section The uterine cavity measured 2¾ inches, and it was filled with shaggy tufts of hypertrophied mucosa The left tube was 4 inches in length and was much thickened and dilated The nodular ovarian tumour was kidney shaped with a thin smooth capsule, it was hard, solid, and greyish yellow on section Histologically, it exhibited areas in which the 'granulosa cell (öophoroma folliculare) type predominated, mixed with large spindle cells of a fibroblast type Evidently it was a "mixed" tumour containing simple carcinomatous and spindle celled sarcomatous elements This case showed that uterine mucous and muscular hypertrophy may occur in association with "mixed" ovarian tumours

Pathology

436 Estimation of Blood Alcohol in Drunkenness

The question of the value of the estimation of alcohol in the blood in cases of alleged drunkenness is reopened by R GOLDHAHN (*Med Welt*, March 11th 1933, p 336), who states that the determination of alcohol in the blood can be carried out on a single drop of blood, but requires the assistance of a trained chemist As a result of such analyses in a large series of cases Widmark has constructed a curve correlating the incidence of symptomatic drunkenness with the percentage of alcohol in the blood From this curve it appears that alcohol may be present in the blood up to a concentration of 80 mg per 100 c cm without the subjects showing any manifestation of being under the influence of drink, at a concentration of about 150 mg per 100 c cm 50 per cent of cases are demonstrably or visibly drunk, whilst at about 200 mg per 100 c cm all are drunk In the police protocols of Germany, if a case is reported as not drunk by the medical attendant but on analysis of the blood 200 mg per 100 c cm are found, then the diagnosis of the doctor is negatived According to Widmark 160 mg per 100 c cm is the upper limit at which it may be considered that a driver may control a vehicle Goldhahn amplifies this by pointing out that motor cyclists and bicyclists show insufficient control at far lower levels of blood alcohol than 160 Attention is drawn to a formula elaborated by Widmark, by means of which it is possible to calculate the intake of alcohol from the blood alcohol, the body weight, and the time between the ingestion of the fluid and the taking of the blood The author has found that this estimate gives values within 5 per cent of a known amount of alcohol taken

437 Active Immunization against Typhus Fever

H ZINSSER and M R CASTANEDA (*Journ Exper Med*, March, 1933, p 381) describe successful vaccination experiments on guinea-pigs against the Mexican typhus virus The vaccine used was prepared from the peritoneal exudate of rats that had been inoculated with the virus and whose resistance had been lowered by exposure to radiation with short wave length *x* rays The peritoneal exudate of such animals contained large numbers of Rickettsiæ, these were treated by formol, so that the vaccine contained only dead organisms Experiments showed that subcutaneous or intraperitoneal inoculation of guinea-pigs with this vaccine afforded them protection against the subsequent intraperitoneal inoculation of approximately 100 to 250 infective doses of Mexican typhus or of the endemic American typhus virus but only partial and feeble protection against the European typhus virus In a second paper (ibid, p 391) the authors describe the production of an immune serum by treatment of a horse with the irradiated rat Mexican typhus virus vaccine Before immunization the serum of the horse agglutinated *B proteus* X 19 in a titre of 1/40, after immunization the titre had risen to between 1/160 and 1/320 Further agglutination experiments showed that the serum agglutinated a suspension of the European virus obtained from lice to a titre of between 1/320 and 1/640 By the use of guinea-pigs this serum was found to afford protection against the Mexican typhus virus when it was injected a week before, or at the time of, or seventy two hours after the infecting dose On the other hand, it did not protect against the European virus This discrepancy between the agglutinating and protective powers of the serum in relation to the European virus is very puzzling, and calls for further investigation

For fastidious Patients

who cannot take cod liver oil or thick oily emulsions, this new preparation supplies in a pleasant tempting form vitamins A and D (equivalent to its own volume of high grade cod liver oil) together with calcium lactate (7½ grains in each ounce)

4-oz. bottles 1/6 8-oz. bottles 2/6

Non-Operable Hernia Can Be Controlled or Supported—

Safely, Comfortably, Adequately.

The Spencer Supporting Corset and the Spencer Abdominal Belt for hernia embody all the features desirable and necessary in a garment to control or support inguinal, ventral, femoral, or umbilical hernia.

They fit perfectly; therefore they stay in position at all times, and give constant safety and comfort to the patient.

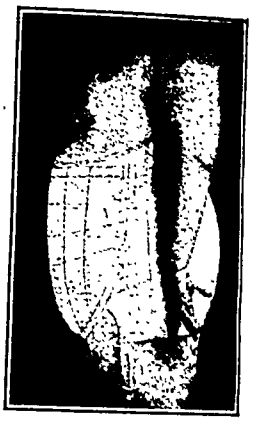
They are non-elastic; therefore they retain the hernia or prevent its protruding further.

They are strong; therefore they give great security.

They are washable; therefore they are hygienic.

They are durable; therefore they are economical.

They are designed expressly for the individuals who are to wear them; therefore the physician can prescribe exactly what his patient needs.



Above is shewn one type of Spencer Abdominal Belt, for the control of umbilical hernia.

The belt is made in two sections—a close fitting, long back, and a strong flexible front, attached to the back by a set of straps and buckles which also give adjustment.

The Spencer Corsetière in your town will call at your Surgery or at your patient's home to take measurements under your supervision. Spencer Supports and Corsets are never sold in shops.

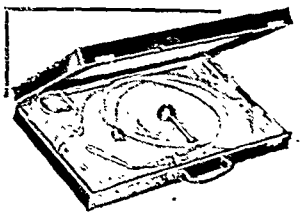
Name, Dr. ..... *Address* .....



The Colonator outfit is fitted in attache type of case for convenience of transport.

COLONIC LAVAGE

As an Aid in Medical Diagnosis and a Valuable Therapeutic Method in the Treatment of Numerous Ailments Particularly when they arise from Auto-Intoxication resulting from Intestinal Stasis.

WITH SPECIAL REFERENCE TO A NEW SCIENTIFIC PORTABLE APPARATUS COMBINING CONVENIENCE SIMPLICITY AND EFFICIENCY

COLONIC lavage, which in the Eighteenth Century enjoyed Royal Patronage, and an enormous vogue in the best circles of Society, has re-emerged after a period of comparative oblivion to receive once more the endorsement and recommendation of the Medical Profession. This is largely due to the invention of new and improved apparatus.

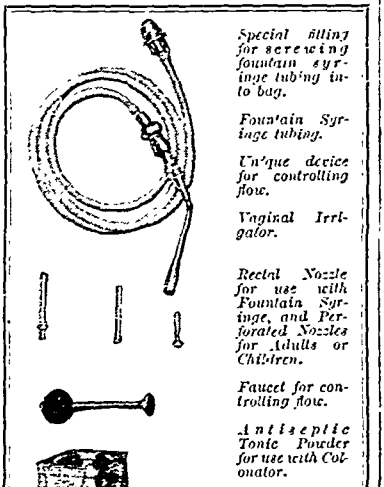
The elaborate apparatus installed in institutions, however, has left a blank still to be filled.

We refer to the vast number of cases in private practice where what is really needed is an outfit that conforms with the latest dictates of medical science, yet is convenient, simple, and portable, and can be operated by the nurse in attendance, or even by the patient himself with little or no supervision if his condition of health permits it.

Such an outfit is now available in the COLONATOR. This apparatus consists of a stout rubber bag, with detachable vulcanite nozzle, which in place of the usual end opening, has pin-hole perforations at the sides. The disadvantage and danger of directing a stream of water violently against the Colon Wall, as may happen with ordinary apparatus, is thus avoided. The flow of the water, being actuated by the pressure of the body seated upon the rubber bag, can thus easily be retarded at will, while the control tap also allows the volume to be increased, or diminished, or the flow instantly cut off altogether the moment this is desired. By means of this apparatus the entire contents of the Colon can be progressively evacuated as far as and including the Caecum.

The value of the apparatus in the diagnosis of obscure conditions will at once be realised. A few such cases among many where it can be of undoubted service are:—

1. Where Mucous Colitis is suspected.
2. Cases of Dysentery thought to be of bacillic origin.
3. Prior to an X-ray examination of the bowels, and in all abdominal conditions where a clean bowel simplifies examination and is a safeguard against errors in diagnosis.
4. The suspected presence of parasitic pests.



Special fitting for screwing fountain syringe tubing into bag.

Fountain Syringe tubing.

Unique device for controlling flow.

Vaginal Irrigator.

Rectal Nozzle for use with Fountain Syringe, and Perforated Nozzles for Adults or Children.

Faucet for controlling flow.

Antiseptic Tonic Powder for use with Colonator.

Emollient Lubricant and Brass Cup for seating bag on hot-water bottle.

As to the therapeutic uses of the Colonator, these obviously embrace all those numerous conditions which are directly or indirectly traceable to auto-intoxication arising from intestinal stasis. Apart from this, the advantage of having such a simple, convenient, and easily portable apparatus at hand for use in urgent cases of Food Poisoning, in numerous cases of Chronic Poisoning, Drug Addiction, Tobacco Poisoning, etc., may be emphasized.

The following are a few of the conditions which, as is well known, are greatly benefited by Colonic Irrigations, and for the treatment of which the Colonator may be strongly recommended as an eminently practical and efficient apparatus:—

Appendicitis, threatened, and in cases where it is desirable to avoid operative treatment.

Asthmatical attacks, where the dyspnoea are aggravated if not actually caused by constipation.

Blood Pressure, abnormal.

Bronchitis and Catarrhal Conditions, Colitis, Dysentery, Dyspepsia, Gastric Ulcer, Gastric Disorders such as Hyper-Acidity, Liver Diseases, Nervous Disorders, Rheumatic Ailments, Sexual Disorders, numerous Urinary Disorders.

The following is a summary of some of the important practical features of the Colonator:—

1. The Hot Water Bag, made of the finest rubber, and extremely tough, strong, and durable, is shaped to fit comfortably upon the ordinary lavatory seat.

2. The flow of the water is actuated by the gentle pressure of the body, while the Control Tap allows the volume to be gradually increased or decreased, or the flow cut off altogether at will.

3. The nozzle is pin-hole perforated at the sides, without any orifice at the extremity, to provide complete insurance against a powerful jet of water being directed violently against the Colon wall in any circumstances.

4. Nozzles are supplied with all outfits in two sizes for children and adults.

IN AN EDITORIAL NOTICE OF THE COLONATOR THE "BRITISH MEDICAL JOURNAL" SAYS:—
"... a new apparatus for colonic lavage, which seems to combine ease in operation with ingenuity and simplicity in design ... The complete apparatus is put up in a convenient and light portable case."

5. A length of rubber tubing and a special fitment is provided for use in feminine hygiene.

6. The movable parts are beautifully machined, ensuring perfect fitting and easy detachment.

7. The complete outfit is supplied in fitted attache type of case for convenience of transport.

Full particulars of the Outfit, and of Special Terms to the Profession, will be sent to medical men on application to:—

The COLONATOR Co.
Premier House,
197, BATH STREET, GLASGOW, C.2

INSULIN 'A.B.'

The world-wide supremacy of Insulin 'A B' is due to its unequivocal purity no less than to its well-known potency and stability under all conditions

Insulin 'A B' contains the minute quantity of phenolic preservative originally recommended by the Medical Research Council and still considered necessary by bacteriologists (*Lancet* Sept 12, 1931, pp 582-584) as a complete safeguard against the development of bacteria that may be accidentally introduced during self-administration.

DECADES OF EXPERIENCE ENDORSE VAPO-CRESOLENE AN ANTISEPTIC INHALANT

For over 50 years physicians have prescribed the Vapo-Cresolene principle of Inhalation as an effective means of treating certain respiratory affections. These cresols of coal-tar, antiseptic, yet harmless when vaporized relieve paroxysmal cough and dyspnoea as in Whooping-Cough, Catarrhal Croup, and Bronchial Asthma, Cough in Broncho-pneumonia, and the Bronchial symptoms of Scarlet Fever and Measles.

The method of vaporization is particularly adapted to treating bronchial infections in very young children. Laboratory tests under sick-room conditions show these vapours to be destructive to pathogenic bacteria.

A Distinct Advance Over Preparations of Acetyl-Salicylic Acid

Acetyl-salicylic acid possesses a notable disadvantage. Physicians have proved that it cannot be tolerated by patients suffering with a delicate stomach. Consequently, the value of this medicament in the wide field in which it is indicated is very seriously reduced.

"Alasil" completely overcomes this objection. By combining calcium acetyl-salicylate with "Alocol," unfavourable secondary action upon the stomach is prevented. This beneficial influence is undoubtedly due to the presence of "Alocol" (Colloidol Hydroxide of Aluminium), which preparation has brilliantly stood the test of practice in the treatment of hyperacidity and other ill conditions of the gastric tract. "Alasil" is therefore a triumph over acetyl-salicylic acid. It enables higher doses to be administered and maintains the patient's system under its influence for a greater length of time. Analgesic, Antipyretic, and Sedative, "Alasil" is indicated in all cases where acetyl-salicylic acid has been used heretofore.

A supply for clinical trial with full descriptive literature sent free on request.

LIN. BETULAE CO.

(Hewlett s)

In the treatment of

RHEUMATISM, SCIATICA, LUMBAGO, SYNOVITIS, PHLEBITIS, etc.

This liniment affords prompt local analgesic effect, whereas internal administration of Salicylates frequently affects the heart, and continued use leads to headache nausea tinnitus etc.

Lin Betulae Co acting promptly through the cutaneous surface has more than a local action but causes no derangement of the system

The external dose of Lin. Betulae Co (Hewlett s) is one drachm and it may be rubbed on the skin over the affected part if friction is permissible The Liniment can also be applied on absorbent cotton wool covered by impermeable tissue, when it is rapidly absorbed A mixture of Lin Betulae Co and Lin Chloroformi applied on warm lint to the limb has given relief in Phlebitis

CAUTION.—Lin. Betulae Co (Hewlett s) is a rich orange colour whilst imitations are usually colourless or pale yellow

PRICE 10/6 per lb

IODERMIOL

A bland emollient and non irritating preparation, containing approximately 10% Iodine easily absorbed by the skin under the influence of gentle friction yet causing no stain or inflammation.

Iodermiol is of great value in the treatment of Pleurisy Sciatica, Glandular Enlargements Muscular Rheumatism etc., etc.

PRICE 1/- per oz 12/- per lb

UNG. IODERMIOL

An ointment of Iodermiol that is superior to the B.P Ointment of Iodine as it does not harden or discolour the skin but acts as a resolvent and antiseptic.

It has been found most useful for reducing Inflammation and Enlarged Glands Rheumatic and Gouty Affections Lumbago Sciatica, Swollen and Stiff Joints, Parasitic and Chronic Skin Diseases and Ringworm.

PRICE 6/- per lb

COMPOUND SYRUP OF HYPOPHOSPHITES

"FELLOWS"

(Trade-Mark)

It supplies the needed minerals

". . . . of sound therapeutic value in chronic gonorrhoea."

The remarkable results which have followed the oral administration of Caprokol in the collateral treatment of gonorrhoea over an extended period in the V.D. Clinic attached to an important infirmary in this country demonstrate the value of this urinary antiseptic as a valuable adjunct to the routine treatment of gonorrhoea, one physician describing it as *'of sound therapeutic value in chronic gonorrhoea.'*

Likewise in many other chronic infections of the urinary system Caprokol therapy brings relief in many cases in which other forms of treatment have failed.

GLUCOSE
LIFE'S VITAL FORCE

A sample of "Dextrosol" for clinical trial, and bibliography "Remedial Uses of Dextrose" will gladly be sent on request, free of charge to Medical Practitioners in the British Isles.

...where depleted energy means protracted recovery-

Where illness has so depleted the patients' reserves of energy as to make convalescence unduly protracted a course of "Dextrosol" will facilitate complete recovery. This is identical with blood sugar, needs no digesting, and assists the liver to fulfil its antitoxin functions. In simple cases of Exhaustion, Nervousness, Intestinal Disorders, Acidosis and the like its prescription will be found efficacious.

IDOZAN IS BEING REGULARLY PRESCRIBED BY DOCTORS IN FIFTEEN DIFFERENT COUNTRIES

Effective Ferrotherapy

IDOZAN IS A COLLOIDAL IRON SOLUTION, NEUTRAL, AND CONTAINING 5 PER CENT. OF PURE IRON (Fe).

One teaspoonful of IDOZAN contains 25 ctgrms. of pure iron (Fe).
One dessertspoonful of IDOZAN contains 50 ctgrms. of pure iron (Fe).
One tablespoonful of IDOZAN contains 75 ctgrms. of pure iron (Fe).

Thus, by means of relatively small doses of IDOZAN it is possible—without any inconvenience to the patient—to give much larger doses of iron than could be accomplished with many of the older preparations. In cases of severe anaemia, for instance, one may very well give the patient one tablespoonful of IDOZAN three times daily. This dosage means a daily intake of 2.25 grams of pure iron.

Packings—8-oz., 40-oz., & 80-oz. bottles.

REGETHERM POULTICE

CLEAN AND CONVENIENT IN USE

More certain in its action than the old-fashioned poultice

The healing action of Regetherm Antiphlogistic Poultice is governed by its ability to prolong and maintain an even degree of heat over a lengthy period. Moreover, the ingredients are so balanced that this action does not set up any counter-irritation, but allays pain, ensures an even circulation through the congested areas, and thus induces natural and pain-free rest.

The Medical Profession will appreciate the fact that the action of Regetherm Poultice is much superior to that of fomentations or linseed poultices, and can be relied upon as an efficient aid in the treatment of all types of inflammation.

MARMITE

(Registered Trade Mark)

In Vitamin B Deficiency

Marmite is prescribed in all conditions associated with Vitamin B deficiency; it is ordered—often a teaspoonful three times a day and sometimes more—to prevent and correct constipation, to guard against infectious diseases, in malnutrition, in anorexia, and as a tonic in general debility and convalescence.

For all infants the recommendation made in the Medical Research Council's Report is:—

"Marmite—for Vitamin B complex—a small quantity daily."

(*Vitamins: A Survey of Present Knowledge*, 1932, p.276)

In the Treatment of Anæmias

Marmite is stated to be of particular use in the treatment of certain anæmias. That Addisonian pernicious anæmia can respond to Marmite therapy is a matter of no little importance to all those who have cases of this disease under their care. It is claimed that primary and relapse cases respond to large doses of Marmite, whilst maintenance cases require only small quantities.

An investigator remarks:—

"I have treated all my 'maintenance' cases with Marmite. Without exception these have done well."

(*The Lancet*, October 8th, 1932, p. 781)

In Jars: 1 *oz.* 6*d.*, 2 *oz.* 10*d.*, 4 *oz.* 1/6, 8 *oz.* 2/6, 16 *oz.* 4/6.

HORLICK'S MALTED MILK

EXPERIENCE has shown that Horlick's Malted Milk forms an ideal food during illness.

Made from pure, fresh, full-cream cow's milk combined with the nutritive extracts of wheat and malted barley, Horlick's is delicious to the palate, refreshing and sustaining. It is partially predigested during manufacture—the starch of the grain is wholly converted into the readily assimilable maltose and dextrin, and a considerable portion of the protein is available for direct assimilation.

Horlick's is bland and soothing, and is excellent in all cases where small, light, easily digested meals are indicated. In many cases it can be taken and retained when other foods are rejected.

Ordinarily, Horlick's requires mixing with water only, but, if necessary, it can be "fortified" by the addition of milk, cream, beaten-up eggs, olive oil or alcoholic stimulants.

TO A PÆDIATRICIAN

to whom acidosis is a daily problem in young lives

THE child who will not eat, the child who eats too much, the child who is constipated, the child who suffers from diarrhœa—ACIDOSIS complicates each condition. It may be a skin eruption, an otherwise unaccountable listlessness and fatigue, sleeplessness, nervousness; a train of symptoms and no help from the patient.

You are in search of the best and safest measure to restore the alkali balance—and we have no hesitation in recommending Alka-Zane to you. If the satisfactory experience of others means anything, you will try Alka-Zane on this score alone. Nothing enters into the composition of Alka-Zane that is marked by doubt of its therapeutic value. Only the carbonates, phosphates and citrates of sodium, potassium, calcium and magnesium to form a palatable drink in solution. No lactates, no tartrates, no sulphates; no sodium chloride.

Alka-Zane may be dissolved in water and added to milk after effervescence has subsided.

Let us send you a trial supply. There is no obligation or cost.

ALKA-ZANE *for Acidosis*

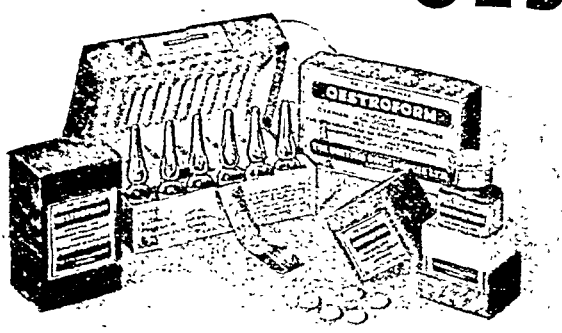
OESTROFORM



Oestroform is a standardised preparation of the crystalline ovarian follicular, or oestrus-producing, hormones.

The function of the follicular hormones in the female is to regulate the sex cycle and to maintain the female accessory and secondary sexual organs in the fully-developed condition characteristic of the organism after puberty.

Oestroform is available in sterile solution for injection, also in tablets for oral administration. The solution and the tablets are standardised to an activity of approximately 500 "rat" units per c.c. or per tablet; thus it will be seen that Oestroform is highly active, and, moreover, it is now offered at a price which permits of its being employed as a routine measure in the ordinary course of general practice.

Forethought during Pregnancy

As a result of widespread investigations on the subject of safety in motherhood the conclusion was drawn that *"forethought during pregnancy and during the early life of the future mother can materially reduce the risks of childbirth"* and that *"contracted pelvis should be prevented" (B.M.J.,* Feb. 18th, 1933, p. 257).

An important aspect of *"forethought during pregnancy"* is the ingestion of Vitamins A and D in an abundance by the mother—Vitamin A to safeguard against infection and Vitamin D to ensure the assimilation of adequate quantities of lime salts to promote correct formation of the skeletal frame of the foetus and to forestall difficult child-bearing from contracted pelvis when the female child comes to maturity.

Radiostoleum provides these essential Vitamins A and D in scientifically-balanced proportions, and its daily ingestion is now regarded as an essential prophylactic measure during pregnancy and lactation.

Station Eden Park (Southern Railway)

President LORD WAKEFIELD OF HYTHE C B E LL D
Treasurer SIR LIONEL FAUDEL PHILLIPS Bart
Physician Supt J G PORTER PHILLIPS M D, F R C P

This Registered Hospital is now situated at Monks Orchard in some 250 acres of park pleasure and farm grounds
Applications can be considered on behalf of patients of the educated classes in a presumably curable condition
With a view to early treatment voluntary or uncertified patients are admitted
Patients who can contribute 5 guineas weekly towards the cost of treatment and maintenance may be received as vacancies arise The Committee will also consider applications for admission at lower rates and in certain cases will be prepared to admit patients free of charge
Every facility for specialized investigation and treatment is provided in the Lord Wakefield Science and Treatment Unit In this unit is found the X Ray and Dental Departments and the Bio-Chemical Pathological and Psychological Laboratories
Furthermore provision is made for Electro Therapy and Hydro-Therapy to be carried out in all their forms and Occupational Therapy under competent instruction is encouraged
In addition to the Resident Medical Staff Consultants in special branches of Medicine and Surgery are available whenever required
The comfort of sensitive patients is greatly enhanced by the fact that the majority are given single bedrooms
For forms and further particulars apply to the Physician Superintendent at the Hospital

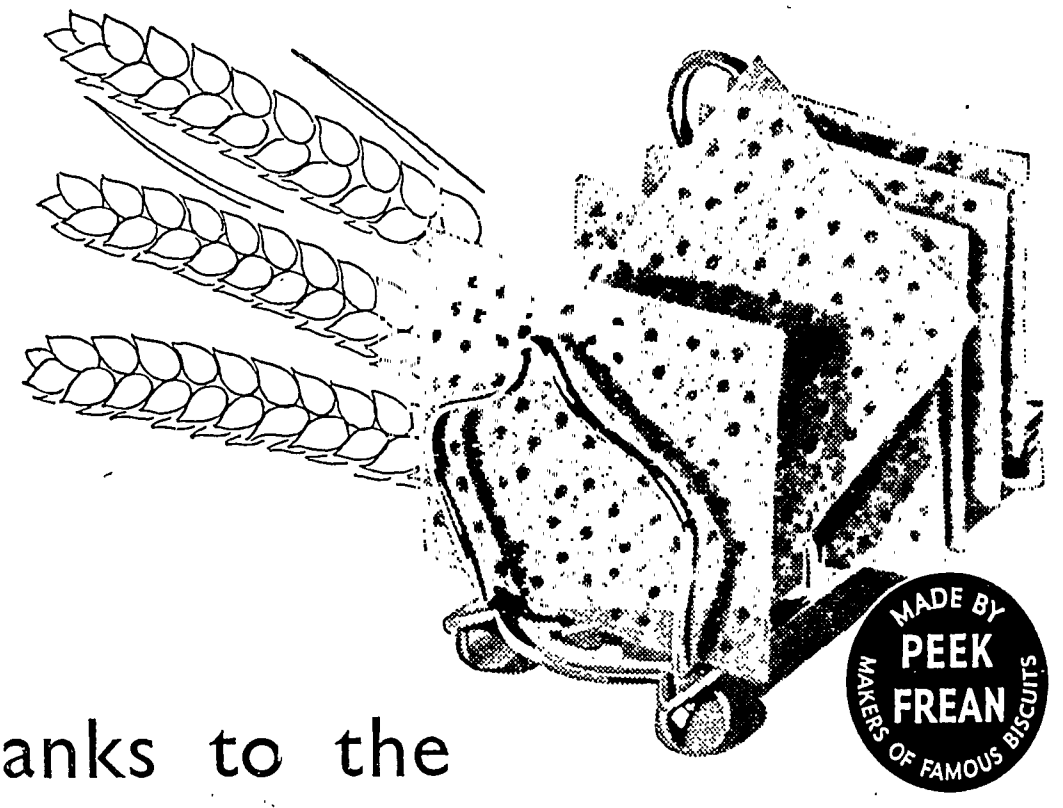
H J CLOUT
General Superintendent



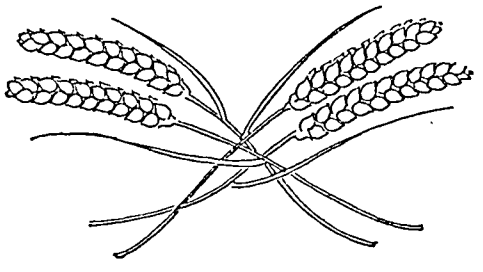
Thanks to the whole wheat in

Vita-Weat

REGD.

(the all-British Crispbread)

constipation can be counteracted without drugs



VITA-WEAT contains the bran of the whole wheat berry in just that degree of fineness which ensures natural elimination. Moreover, for greater ease of digestion it has the wheat starch thoroughly broken up. And its ripe 'crunchiness' tempts jaded appetite and encourages proper mastication.

Analysis gives the following comparison with wholemeal bread :—

	Vita-Weat (*The Lancet*)	Wholemeal Bread (*The Practitioner*)
Moisture - - -	4.90	45.00
Protein - - - -	10.32	6.30
Fat - - - - -	7.90	1.20
Carbohydrates, etc. - -	74.28	46.30
Mineral matter, ash, etc.	2.60	1.20
	100%	100%
Calorific Value per lb.	1846	1105

The manufacturing process conserves all three vitamins—A, B, and D. Here, then, in an ideal substitute for ordinary bread or toast, are all the foodstuffs essential to vigorous health, complete with the roughage required to stimulate peristalsis without undue irritation of the intestinal mucous membrane.

M2

ROYAL ARMY MEDICAL CORPS.

TWENTY-FIVE permanent COMMISSIONS in the ROYAL ARMY MEDICAL CORPS will be offered on July 27th, 1933 Applications should reach the War Office not later than July 21st, 1933

Candidates will be selected for commissions without competitive examination, and will be required to present themselves in London for interview and medical examination on July 27th 1933 They must be under 28 years of age on August 1st, 1933, and registered under the Medical Acts

Officers of the R A M C are liable to serve in any part of the world where British troops are quartered

Ample opportunities exist in the Army for clinical professional work both Medical and Surgical, as well as for the study and practice of Hygiene, Pathology, and all the special branches

The cost of Post-Graduate study, which is compulsory, is met from Army Funds

Emoluments Pay—From £356 to £1,542 a year according to rank **Allowances**—Free quarters, fuel and light servant and rations, or cash allowances in lieu, totalling from 6/5 to 23/3 a day according to rank (£117 to £424 a year)

The above rates of allowances apply to Home Commands only At certain stations abroad the rates are considerably higher

Candidates who have held a full-time house appointment in a recognized civil hospital before appointment to a permanent Commission in the R A M C may, subject to certain conditions, be allowed to count the period of service in such an appointment, up to a maximum of 12 months, as Army service for promotion, increase of pay, and retirement

Gratuties on Retirement—After 7 years' service as a medical officer £1,000
" 15 " " " " £2,800
" 18 " " " " £3,500

Current rates of retired pay range from £352 10s per annum, normally earned by a Major after 20 years' service, to £890 per annum, the maximum for which a Major General is eligible The rates of pay and retired pay are subject to revision on or before April 1st, 1934

Outfit Grant.—An officer on joining receives £50 as outfit allowance

Married Officers' Allowances—Officers of 30 years of age and over who are married are entitled to draw special rates of allowances

A Voluntary Widows' and Orphans' Fund exists for officers of the Corps

All particulars may be obtained by application, in writing or personally, to the Assistant Director-General Army Medical Services, The War Office, Whitehall, London, S W 1

COUNTY COUNCIL OF MIDDLESEX

Further particulars may be obtained from the House Governor

ARTHUR G ELLIOTT
House Governor

TAKING human milk as the standard, a good deal of the difficulty in using cow's milk for infant feeding lies in the nature of the proteins of cow's milk. In breast milk much of the protein is present in a form that is not curdled in the stomach ; in cow's milk the contrary is the case.

■ ■ ■ ■

The "curd" produced in the stomach from ordinary liquid cow's milk can be modified considerably to the great advantage of the infant. By drying the milk *in vacuo* in the presence of a suitable colloid (dextrin-maltose) the protein particles are prevented from coagulating to a solid clot.

■ ■ ■ ■

The "curd" formed in the stomach of the infant when the "Allenburys" Modified Milk Foods are used is finely flocculent, light, and readily digestible.

■

This announcement regarding the 'Allenburys' Foods is No. 4 of a series which will be continued.

INDIAN MEDICAL SERVICE

Recruitment of European Officers.

Applications are invited from medical men for permanent commissions in H.M.'s Indian Medical Service. The terms offered include a gratuity of £1,000 on retirement after six years' service, or £2,500 after 12 years' service, together with free return passages for those who no longer desire to remain in the Service. In other respects the terms will be as detailed below.

Candidates must be European British subjects under 32 years of age at the time of application and must be registered under the Medical Acts in force in Great Britain and Northern Ireland.

CAREERS

The Indian Medical Service offers wide opportunities of medical experience including clinical preventive specialist and research work. At the beginning of his career an officer is employed on the military side which has medical charge of the Indian Army. Promotion is on a time scale up to the rank of Lieutenant Colonel and by selection to the ranks of Colonel and Major General. An officer may apply after one year's Indian Service to have his name registered for transfer to the civil side from which appointments are made to Civil Surgeoncies which are established at the principal civil centres to provide for the medical needs of civil officials and for general medical administrative purposes to specialist (for example public health and bacteriological) services to research posts and to professorships at the Medical Schools.

NOTE.—It is not possible to state at present what, if any prospects of employment on the civil side will be open to Indian Medical Service Officers under the proposed new constitution for India.

PAY

Owing to the state of the financial emergency at present prevailing in India the existing monthly rates of pay which are as follows are subject to a temporary reduction of 5 per cent.

Rank	Service in Rank.	Basic Pay	Overseas Pay	Year of Total Service
		Rs.	Rs.	
Lieut.	—	500	100	1st
			100	2nd
			100	3rd
Capt.	(i) During first 3 years service as Captain	600	100	4th
			£15	5th
			£15	6th
	(ii) With more than 3 and less than 6 yrs. service as Captain	750	£25	7th
			£25	8th
			£25	9th
	(iii) With more than 6 years service as Captain	850	£25	10th
			£25	11th
			£30	12th
Major	(i) During first 3 years service as Major	900		
	(ii) With more than 3 and less than 6 years service as Major	1100		
	(iii) With more than 6 years service as Major	1250		
Lieut.-Col.	(i) Until completion of 23 years total service	1,000	£30	17th and over
	(ii) During 24th and 25th years service	1800		
	(iii) After completion of 25 years total service	1,000		
	(iv) When selected for increased pay	1250		

EXTRAS.—In addition to the above rates various allowances are admissible for a large number of special appointments on both the military and the civil side which may be held by members of the Indian Medical Service. Special high rates of pay are also attached to the numerous administrative appointments open to officers in both branches of the Service.

ANTEDATES IN COMMISSION

Any service rendered by an officer during the war as a medical or combatant officer or in a position usually filled by an officer may be counted as service for increments of pay promotion retirement and retired pay but not for gratuity.

One half of any service in the ranks during the war may be counted as service for retirement and retired pay only.

Candidates possessing certain higher medical qualifications may be granted an antedate of one year in their commissions. Past service in certain hospital appointments may also render candidates eligible for an antedate of one year. Persons holding or about to hold resident posts at recognized hospitals may be seconded in those posts for a period not exceeding one year. The maximum period of antedate secondment or antedate and secondment combined admissible under this paragraph is limited to one year.

OUTFIT ALLOWANCE.

Officers on appointment will receive an allowance of £50 towards the cost of outfit.

PRIVATE PRACTICE.

With the exception of Administrative Officers military or civil and officers holding certain special appointments officers are not debarred from taking private practice so long as it does not interfere with their proper duties.

LEAVE

Leave can be taken at reasonable intervals and adequate rates of leave pay are provided. Extra leave (known as study leave) which may not exceed 12 months in all during an officer's service may be granted to officers desirous of pursuing special courses of study of a post graduate nature. During such leave study allowance at present fixed at the rate of 12s. a day in the United Kingdom £1 a day on the Continent of Europe and £1 10s. a day in the United States of America is granted to an officer in addition to ordinary rates of leave pay.

PENSIONS

The rates of pension are as follows	Per annum £
After 17 years service for pension	400
18	430
19	460
20	500
21	540
22	580
23	620
24	660
25	700
26	750
27 —	800

These rates are subject to alteration on account of a rise or fall in the cost of living as compared with the year 1919 to an extent not exceeding 20 per cent. in all. At present a reduction of 8¼ per cent. is being made on this account.

There are additional pensions ranging from £65 to £350 per annum for officers who have held administrative appointments.

PASSAGES.

An officer on appointment is provided with free passage to India. The families of officers who are married prior to the date of the officers embarkation on first appointment will also be provided with free passage to India subject to the payment of messing charges.

Officers and their families are also eligible for passage concessions under which they are granted a certain number of return passages home at Government expense during their service.

INSTRUCTION PRIOR TO EMBARKATION

Officers are required to undergo courses of instruction at the Royal Army Medical College and at Aldershot lasting approximately six months prior to their embarkation for India on first appointment. Information as to the rates of pay admissible during this period and subsequently up to arrival in India is contained in the memorandum referred to below.

A memorandum giving full details regarding these appointments and forms of application may be obtained from the Under-Secretary of State for India, Military Department India Office London S.W.1. The Selection Committee will meet at the India Office early in July next and the selected candidates will be required to join a course of instruction commencing early in August prior to sailing for India early in 1934. Applications should be submitted as soon as possible.

"THAT'S JUST AS IT SHOULD BE..."

Medical opinion is agreed as to the wisdom of breast feeding. Pre-natal diet thus merits careful consideration.

During the pre-natal period, Robinson's 'Patent' Groats and milk provides an adequate supply of calcium so essential to expectant mothers. Prescribed for nursing mothers it promotes a free secretion and adds materially to the nutritive value of the breast milk. And both before and after the baby is born, Robinson's 'Patent' Groats and milk builds and sustains a mother's strength and generally assists the digestive system.

ROBINSON'S "PATENT" GROATS

KEEN, ROBINSON & CO. LTD., CARROW WORKS, NORWICH.

Descriptive pamphlets and clinical trial sample will gladly be sent on application.

AUSTRALIAN ABORIGINAL PRODUCING SICKNESS IN ANOTHER BY "IMITATIVE MAGIC."—The belief underlying this practice is that the imitation of a condition or an event will bring about that which is imitated. The figure here depicted represents a man in the act of causing the death of an enemy by cutting his throat and ripping his abdominal wall. With a charm consisting of a triangular piece of pearl shell he makes two horizontal and vertical passes, to cut the throat and the abdomen respectively. The reason for this unusual posture is his desire not to make sweeps of too wide an extent and thus involve innocent persons who may happen to come within his compass. By bending down he limits the horizontal passes to the space between his legs.

5 Years ahead—

Scientific research confirms the efficacy of the Odol formula

Scientific research, aimed at the discovery of more effective and less toxic antiseptics, and extending over many years, has now reached a successful conclusion. Hitherto, no antiseptic was known which had *all* the desired properties and would give the desired results.

Experiments by scientists of International repute have proven that a new group of substances — esters of p-hydroxybenzoic acid—register a considerable advance over the principal ingredients previously employed for the purpose, and are, in fact, less toxic in nature than the widely used benzoic acid.

These esters fulfil all the requirements of dentifrice formula in that they are odourless, tasteless, non-irritating; they are pure white in colour, are stable, and their destructive action upon the lower organisms is uniform and long-lasting.

FOR 5 YEARS THE ODOL FORMULA HAS INCLUDED the Methyl Ester — now so strongly recommended by prominent Scientists for use in Dentifrices.

Odol

TOOTH PASTE

is, scientifically, the most perfect and effective dentifrice in the World.
